

ALGORITHM & FLOWCHART MANUAL for STUDENTS

Part (1)

Algorithm in Programming:

In programming, algorithm is a set of well-defined instructions in sequence to solve the problem.

HOW TO WRITE ALGORITHMS:

Step 1 Define your algorithms input: Many algorithms take in data to be processed, e.g. to calculate the area of rectangle input may be the rectangle height and rectangle width.

Step 2 Define the variables: Algorithm's variables allow you to use it for more than one place. We can define two variables for rectangle height and rectangle width as HEIGHT and WIDTH (or H & W). We should use meaningful variable name e.g. instead of using H & W use HEIGHT and WIDTH as variable name.

Step 3 Outline the algorithm's operations: Use input variable for computation purpose, e.g. to find area of rectangle multiply the HEIGHT and WIDTH variable and store the value in new variable (say) AREA. An algorithm's operations can take the form of multiple steps and even branch, depending on the value of the input variables.

Step 4 Output the results of your algorithm's operations: In case of area of rectangle output will be the value stored in variable AREA, if the input variables described a rectangle with a HEIGHT of 2 and a WIDTH of 3, the algorithm would output the value of 6.

Flowchart:

Flowchart is diagrammatic /Graphical representation of sequence of steps to solve a problem. To draw a flowchart following standard symbols are use

Symbol	Purpose	Description
	Flow line	Used to indicate the flow of logic by connecting symbols.

Timetabling III Edmund Burke, Wilhelm Erben, 2003-06-29 This volume is the third in an ongoing series of books that deal with the state of the art in timetabling research It contains a selection of the papers presented at the 3rd International

Conference on the Practice and Theory of Automated Timetabling PATAT 2000 held in Constance Germany on August 16-18th 2000. The conference once again brought together researchers, practitioners and vendors from all over the world working on all aspects of computer aided timetable generation. The main aim of the PATAT conference series is to serve as an international and inter disciplinary forum for new timetabling research results and directions. The conference series particularly aims to foster multi disciplinary timetabling research. Our field has always attracted scientists from a number of traditional domains including computer science and operational research and we believe that the cross fertilisation of ideas from different fields and disciplines is a very important factor in the future development of timetabling research. The Constance conference certainly met these aims. As can be seen from the selection of papers in this volume there was a wide range of interesting approaches and ideas for a variety of timetabling application areas and there were delegates from many different disciplines. It is clear that while considerable progress is being made in many areas of timetabling research there are a number of important issues that researchers still have to face. In a contribution to the previous PATAT conference George M

A clear and lucid bottom up approach to the basic principles of evolutionary algorithms. Evolutionary algorithms (EAs) are a type of artificial intelligence. EAs are motivated by optimization processes that we observe in nature such as natural selection, species migration, bird swarms, human culture and ant colonies. This book discusses the theory, history, mathematics and programming of evolutionary optimization algorithms. Featured algorithms include genetic algorithms, genetic programming, ant colony optimization, particle swarm optimization, differential evolution, biogeography based optimization and many others. *Evolutionary Optimization Algorithms* Provides a straightforward bottom up approach that assists the reader in obtaining a clear but theoretically rigorous understanding of evolutionary algorithms with an emphasis on implementation. Gives a careful treatment of recently developed EAs including opposition based learning, artificial fish swarms, bacterial foraging and many others and discusses their similarities and differences from more well established EAs. Includes chapter end problems plus a solutions manual available online for instructors. Offers simple examples that provide the reader with an intuitive understanding of the theory. Features source code for the examples available on the author's website. Diffraction and Structural Characterization of Materials, Second Edition Vitalij Pecharsky, Peter Zavalij, 2008-11-26 A little over ve years have passed since the rst edition of this book appeared in print Seems like an instant but also eternity especially considering numerous developments in the hardware and software that have made it from the laboratory test beds into the real world of powder diffraction This prompted a revision which had to be beyond cosmetic limits The book was and remains focused on standard laboratory powder diffractometry It is still meant to be used as a text for teaching students about the capabilities and limitations of the powder diffraction method We also hope that it goes beyond a simple text and therefore is useful as a reference to practitioners of the technique The original book had seven long chapters that may have

made its use as a text convenient So the second edition is broken down into 25 shorter chapters The first fifteen are concerned with the fundamentals of powder diffraction which makes it much more logical considering a typical 16 week long semester The last ten chapters are concerned with practical examples of structure solution and refinement which were preserved from the first edition and expanded by another example R solving the crystal structure of Tylenol
