Nitrous Oxide and Climate Change Keith Smith, 2010-08-12 Nitrous oxide N_2O is the third most important in global warming terms of the greenhouse gases after carbon dioxide and methane. As this book describes, although it only comprises 320 parts per billion of the earth's atmosphere, it has a so-called Global Warming Potential nearly 300 times greater than that of carbon dioxide. N_2O emissions are difficult to estimate because they are predominantly biogenic in origin. The N_2O is formed in soils and oceans throughout the world by the microbial processes of nitrification and denitrification that utilise the reactive N compounds ammonium and nitrate respectively. These forms of nitrogen are released during the natural biogeochemical nitrogen cycle but are also released by human activity. In fact, the quantity of these compounds entering the biosphere has virtually doubled since the beginning of the industrial age, and this increase has been matched by a corresponding increase in N_2O emissions. The largest source is now agriculture, driven mainly by the use of synthetic nitrogen fertilisers. The other major diffuse source derives from release of NO_x into the atmosphere from fossil fuel combustion and biomass burning, as well as ammonia from livestock manure. Some N_2O also comes directly from combustion and from two processes in the chemical industry: the production of nitric acid and the production of adipic acid used in nylon manufacture. Action is being taken to curb the industrial point source emissions of N_2O , but measures to limit or reduce agricultural emissions are inherently more difficult to devise. As we enter an era in which measures are being explored to reduce fossil fuel use and/or capture or sequester the CO_2 emissions from the fuel, it is likely that the relative importance of N_2O in the Kyoto basket of greenhouse gases will increase, because comparable mitigation measures for N_2O are inherently more difficult, and because expansion of the land area devoted to crops to feed the increasing global population and to accommodate the current development of biofuels is likely to lead to an increase in N fertiliser use and thus N_2O emission worldwide. The aim of this book is to provide a synthesis of scientific information on the primary sources and sinks of nitrous oxide and an assessment of likely trends in atmospheric concentrations over the next century and the potential for mitigation measures.

Simultaneous EEG and fMRI Markus Ullsperger, Stefan

Debener, 2010-05-28 One of the major challenges in science is to study and understand the human brain. Numerous methods examining different aspects of brain functions have been developed and employed. To study systemic interactions, brain networks in vivo, non-invasive methods such as electroencephalography (EEG) and functional magnetic resonance imaging (fMRI) have been used with great success. However, each of these methods can map only certain quite selective aspects of brain function while missing others, and the inferences on neuronal processes and information flow are often rather indirect. To overcome these shortcomings of single methods, researchers have attempted to combine methods in order to make optimal use of their advantages while compensating their disadvantages. Hence, it is not surprising that soon after the introduction of fMRI as a neuroimaging method, the possibilities of combinations with EEG have been explored. This book is

intended to aid researchers who plan to set up a simultaneous EEG fMRI laboratory and those who are interested in integrating electrophysiological and hemodynamic data As will be obvious from the different chapters this is a dynamically developing field in which several approaches are being tested validated and compared Currently there is no one best solution for all problems available but many promising techniques are emerging This book shall give a comprehensive overview of these techniques In addition it points to open questions and directions for future research *Annales Geophysicae*, 2009 An international multi and interdisciplinary scientific journal of original articles and of short communications in the following fields physics and dynamics of the oceans and seas incl oceanography and marine sciences air sea and air land vegetation interactions incl physical chemical and biological processes modelling and remote sensing of oceans atmospheres and climate physics dynamics and chemistry of the lower middle and upper atmosphere of the Earth incl meteorology and climatology physics of ionosphere and magnetosphere of the Earth incl solar terrestrial relations geomagnetism and magnetic activity interplanetary and heliospheric physics incl solar wind energetic particles and radiation belts of the Earth physics and dynamics of the solar atmosphere incl chromosphere and corona emissions and magnetic activity space plasma physics and active experiments in space Supply Chain Management: Concepts, Methodologies, Tools, and Applications

The microbial nitrogen cycle Bess B Ward, Marlene Mark Jensen, 2015-01-17 Nitrogen is an essential element in biological systems and one that often limits production in both aquatic and terrestrial systems Due to its requirement in biological macromolecules its acquisition and cycling have the potential to structure microbial communities as well as to control productivity on the ecosystem scale In addition its versatile redox chemistry is the basis of complex biogeochemical transformations that control the inventory of fixed nitrogen both in local environments and over geological time Although many of the pathways in the microbial nitrogen cycle were described more than a century ago additional fundamental pathways have been discovered only recently These findings imply that we still have much to learn about the microbial nitrogen cycle the organisms responsible for it and their interactions in natural and human environments Progress in nitrogen cycle research has been facilitated by recent rapid technological advances especially in genomics and isotopic approaches In this Research Topic we reviewed the leading edge of nitrogen cycle research based on these approaches as well as by exploring microbial processes in modern ecosystems
