Handbook of Algorithms for Physical Design Automation Charles J. Alpert,Dinesh P. Mehta,Sachin S. Sapatnekar,2008-11-12 The physical design flow of any project depends upon the size of the design the technology the number of designers the clock frequency and the time to do the design As technology advances and design styles change physical design flows are constantly reinvented as traditional phases are removed and new ones are added to accommodate changes in technology Handbook of Algorithms for Physical Design Automation provides a detailed overview of VLSI physical design automation emphasizing state of the art techniques trends and improvements that have emerged during the previous decade After a brief introduction to the modern physical design problem basic algorithmic techniques and partitioning the book discusses significant advances in floorplanning representations and describes recent formulations of the floorplanning problem The text also addresses issues of placement net layout and optimization routing multiple signal nets manufacturability physical synthesis special nets and designing for specialized technologies It includes a personal perspective from Ralph Otten as he looks back on the major technical milestones in the history of physical design automation Although several books on this topic are currently available most are either too broad or out of date Alternatively proceedings and journal articles are valuable resources for researchers in this area but the material is widely dispersed in the literature This handbook pulls together a broad variety of perspectives on the most challenging problems in the field and focuses on emerging problems and research results

Heterogeneous Cyber Physical Systems of Systems Ioannis Papaefstathiou, Alkis Hatzopoulos, 2022-09-01 Cyber physical systems are the natural extension of the so called Internet of Things They are systems of collaborating computational elements controlling physical entities Cyber Physical Systems of Systems CPSoS are considered The Next Computing

Revolution after Mainframe computing 60 s 70 s Desktop computing because all aspects of daily life are rapidly evolving towards humans interacting amongst themselves as well as their environment via computational devices often mobile and because in most cases systems will employ their computational capabilities to interact amongst themselves CPSoS enable the physical world to merge with the cyber one Using sensors the embedded systems monitor and collect data from physical processes such as the steering of a vehicle energy consumption or human health functions The systems are networked making the data globally available CPSoS make it possible for software applications to directly interact with events in the physical world for example to measure and react to changes in blood pressure or peaks in energy consumption Embedded hardware and software systems crucially expand the functionality and competitiveness of vehicles aircraft medical equipment production plants and household appliances Connecting these systems to a virtual environment of globally networked services and information systems opens completely new areas of innovation and novel business platforms Future CPSoS will have many sophisticated interconnected parts that must instantaneously exchange parse and act on detailed data in a highly coordinated manner Continued advances in science and engineering will be necessary to enable advances in design and development of these complex systems
