Abstract: This study examined the effects of a 12-week, 100% body weight (BW) resistance training program on the body composition and muscle strength of 10 sedentary, middle-aged men. The subjects were divided into two groups: a control group (CG) and an exercise group (EG). The EG performed a 12-week, 100% BW resistance training program, while the CG remained sedentary. The results showed that the EG had significantly greater increases in muscle strength and body composition compared to the CG. The EG also had significantly greater increases in muscle strength and body composition compared to the CG. The results of this study suggest that a 12-week, 100% BW resistance training program can effectively improve muscle strength and body composition in sedentary, middle-aged men.
