Growing Mathematical Minds Jennifer S. McCray, Jie-Qi Chen, Janet Eisenband Sorkin, 2018-09-03 Growing Mathematical Minds is the documentation of an innovative bi directional process of connecting research and practice in early childhood mathematics The book translates research on early mathematics from developmental psychology into terms that are meaningful to teachers and readily applicable in early childhood classrooms It documents teacher responses and conveys their thoughts and questions back to representative researchers who reply in turn In so doing this highly useful book creates a conversation in which researchers and teachers each bring their expertise to bear their communication about these topics informed by the thinking commitment and experience of both groups helps us

better understand how developmental psychology can improve math teaching and how math teaching can in turn inform developmental science The book bridges the gap between research and practice helping teachers to adopt evidence based practices and apply cutting edge research findings and prompting developmental researchers to consider their work within the framework of practice Growing Mathematical Minds identifies and elucidates research with profound implications for teaching children from three to eight years so they develop foundational math knowledge and skills positive attitudes toward math and basic abilities to think mathematically

Elementary Mathematical Models: An Accessible Development without Calculus, Second Edition Dan Kalman, Sacha Forgoston, Albert Goetz, 2019-08-02 Elementary Mathematical Models offers instructors an alternative to standard college algebra quantitative literacy and liberal arts mathematics courses Presuming only a background of exposure to high school algebra the text

introduces students to the methodology of mathematical modeling which plays a role in nearly all real applications of mathematics. A course based on this text would have as its primary goal preparing students to be competent consumers of mathematical modeling in their future studies. Such a course would also provide students with an understanding of the modeling process and a facility with much of the standard non-trigonometric content of college algebra and precalculus. This book builds successively a series of growth models defined in terms of simple recursive patterns of change corresponding to arithmetic, quadratic, geometric, and logistic growth. Students discover and come to understand linear, polynomial, exponential, and logarithmic functions in the context of analyzing these models of intrinsically and scientifically interesting phenomena including polar ice extent, antibiotic resistance, and viral internet videos. Students gain a deep appreciation for the power and limitations of mathematical modeling in the physical life and social sciences as questions of modeling methodology are carefully and constantly addressed. Realistic examples are used consistently throughout the text and every topic is illustrated with models that are constructed from and compared to real data. The text is extremely attractive and the exposition is extraordinarily clear. The lead author of this text is the recipient of nine MAA awards for expository writing including the Ford Evans, P. I. Y. A., and Allendoerfer awards and the Beckenbach Book Prize. Great care has been taken by accomplished expositors to make the book readable by students. Those students will also benefit from more than 1,000 carefully crafted exercises.
