

WORKSHEET - LABELING WAVES

- The highest point on a wave is the crest, while the lowest point is the trough.
- The Amplitude of a wave is a measure of the amount of energy it carries.
- The distance from one crest to the next crest is the wavelength.
- The frequency is a measure of the number of waves that pass a point in a given amount of time.
- The illustration to the right shows a wave. Label each part in the space below:

- crest
- trough
- Amplitude
- wavelength

- Use the five illustrations of waves drawn below to answer the following questions:

- Waves P and Q have the same frequency or wavelength, but wave P has twice the amplitude of wave Q.
- Waves Q and R have the same amplitude, but wave R has twice the wavelength of wave Q.
- Wave T shows a steady frequency but changing amplitude.
- Wave S shows steady amplitude but a changing frequency.
- Waves Q and R have a low amplitude and a steady frequency.

- The following questions refer to the diagram to the right:

- Is this wave transverse or longitudinal? longitudinal
- Letter H represents a compression and letter I represents a rarefaction.
- Letter G represents a wavelength.

Basic and applied research on deception and its detection Wolfgang Ambach,Matthias Gamer,2014-08-07 Deception is a ubiquitous phenomenon in social interactions and has attracted a significant amount of research during the last decades The majority of studies in this field focused on how deception modulates behavioral autonomic and brain responses and whether these changes can be used to validly identify lies Especially the latter question which historically gave rise to the development of psychophysiological lie detection techniques has been driving research on deception and its

detection until today The detection of deception and concealed information in forensic examinations currently constitutes one of the most frequent applications of psychophysiological methods in the field With the increasing use of such methods the techniques for detecting deception have been controversially discussed in the scientific community It has been proposed to shift from the original idea of detecting deception per se to a more indirect approach that allows for determining whether a suspect has specific knowledge of crime related details This so called Concealed Information Test is strongly linked to basic psychological concepts concerning memory attention orienting and response monitoring Although research in this field has intensified with the advancement of neuroimaging techniques such as PET and fMRI in the last decade basic questions on the psychological mechanisms underlying modulatory effects of deception and information concealment on behavioral autonomic and brain responses are still poorly understood This Research Topic brings together contributions from researchers in experimental psychology psychophysiology and neuroscience focusing on the understanding of the broad concept of deception including the detection of concealed information with respect to basic research questions as well as applied issues This Research Topic is mainly composed of original research articles but reviews and papers elaborating on novel methodological approaches have also been included Experimental methods include but are not limited to behavioral autonomic electroencephalographic or brain imaging techniques that allow for revealing relevant facets of deception on a multimodal level While this Research Topic primarily includes laboratory work relevant issues for the field use of such methods are also discussed
