Which receptors in the cell membrane bind to Growth Factor L?

Cancer is the uncontrolled growth of abnormal cells that results from a malfunction in a signaling pathway. The figure below shows a signaling pathway that regulates cell division in spotted gliders.

When the signaling pathway is in the inactive state, a protein called CDI2 is in its active form and prevents the cell from dividing. All other proteins (R1, KR1, KR2, KR3, and CDP1) are in their inactive form.

When the signaling pathway is in the active state, the following steps occur:

- 1) A signal (SR1) binds to a receptor (R1), activating this receptor through phosphorylation.
- 2) The active form of R1 binds and phosphorylates a **kinase** (KR1).
- 3) The active form of KR1 binds and phosphorylates a second kinase (KR2).
- 4) The active form of KR2 binds and phosphorylates a third kinase (KR3).
- 5) The active form of KR3 interacts directly with two proteins, CDP1 and CDI2. KR3 activates CDP1, which enables CDP1 to promote cell division. KR3 inactivates CDI2, preventing CDI2 from inhibiting cell division—thus enabling cell division to occur.
