

Airspace: AIM Chapter 3:

What is airspace?

On any given day, more than 87,000 flights are in the skies in the United States. *pass go!* To handle all of this traffic, the FAA has developed what is called the National Airspace System. The atmosphere is divided up into unique sectors, with each sector's properties based upon that area's level of traffic and any particular needs of that area.

This lesson will cover

1. Terms and definitions of airspace
2. The categories and classes of airspace, along with the requirements to operate in each kind of airspace
3. Special use airspace
4. and other areas of the national airspace system

How airspace gets its classification.

The National Airspace System divides up the classifications of airspace based on:

1. The level of air traffic
2. The nature of the operations conducted
3. The level of safety required
4. National and public interest

Busy airports like Chicago's O'Hare will be classified differently from a single-runway airport in the middle of no-where. Areas like the Kennedy Space Center and Washington DC have unique rules, which restrict or prohibit aircraft from flying in that area due to safety and/or security reasons.

Categories and types of airspace

There are two categories of airspace or airspace areas: Regulatory and Non-Regulatory. Regulatory airspace has a set of specific regulations that govern that area; whereas Non-Regulatory airspace is just used to advise or warn pilots of the operations that are conducted within the airspace

1. Regulatory airspace consists of:
 - a. Classes A, B, C, D, E, G
 - b. Restricted areas
 - c. Prohibited areas
2. Non-Regulatory airspace consists of:
 - a. Military operations areas (MOAs)

Thoma, 2011 **Human Factors Models for Aviation Accident Analysis and Prevention** Thomas G.C. Griffin, Mark S. Young, Neville A. Stanton, 2017-03-02 The investigation and modelling of aviation accident causation is dominated by linear models Aviation is however a complex system and as such suffers from being artificially manipulated into non complex models and methods This book addresses this issue by developing a new approach to investigating aviation accident causation through information networks These networks centralise communication and the flow of information as key indicators of a system s health and risk This holistic approach focuses on the system environment the activity that takes place within it the strategies used to conduct this activity the way in which the constituent parts of the system both human and non

human interact and the behaviour required Each stage of this book identifies and expands upon the potential of the information network approach maintaining firm focus on the overall health of a system The book s new model offers many potential developments and some key areas are studied in this research Through the centralisation of barriers and information nodes the method can be applied to almost any situation The application of Bayesian mathematics to historical data populations provides scope for studying error migration and barrier manipulation The book also provides application of these predictions to a flight simulator study for the purposes of validation Beyond this it also discusses the applicability of the approach to industry Through working with a legacy airline the methods discussed are used as the basis for a new and prospective safety management system *Time-To-Build* Marga Peeters,2012-12-06 As large physical capital stock projects need long periods to be built a time to build specification is incorporated in factor demand models Time to build and adjustment costs dynamics are identified since by the first moving average dynamics whereas by the latter autoregressive dynamics are induced Empirical evidence for time to build is obtained from data from the Dutch construction industry and by the estimation result from the manufacturing industry of six OECD countries **Gene Biotechnology** William Wu,Helen H.
