Student Exploration: RNA and Protein Synthesis

Directions: Follow the instructions to go through the simulation. Respond to the questions and prompts in the orange boxes.

Vocabulary: amino acid, anticodon, codon, gene, messenger RNA, nitrogenous base, nucleotide, ribosome, RNA, RNA polymerase, transcription, transfer RNA, translation

Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

 Suppose you want to design and build a house. How would you communicate your design plans with the construction crew that would work on the house?

I would show them what my thinking is and see how we could make it happen.

Cells build large, complicated molecules such as proteins. What do you think cells use as their "design plans" for proteins?

I would think that cells use DNA as their "design plans" and result with protein.

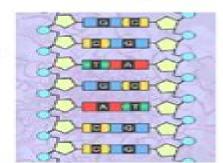

Gizmo Warm-up

Just as a construction crew uses blueprints to build a house, a cell uses DNA as plans for building proteins. In addition to DNA, another nucleic acid, called **RNA**, is involved in making proteins. In the *RNA* and *Protein Synthesis* Gizmo, you will use both DNA and RNA to construct a protein out of **amino acids**.

 DNA is composed of the **nitrogenous bases** adenine (A), cytosine (C), guanine (G), and thymine (T). RNA is composed of adenine, cytosine, guanine, and uracil (U).

Look at the SIMULATION pane. Is the displayed segment a part of a DNA or RNA molecule? How do you know?

It is a part of the DNA because it's a double helix.

 RNA polymerase is a type of enzyme. Enzymes help chemical processes occur quickly. Drag the yellow RNA polymerase molecule onto the DNA strand. Describe what happens.

The enzyme splits the DNA into two separated strands.

Improving Animal Welfare through Genetic Selection Wendy Mercedes Rauw, 2016-07-12 In livestock species breeding goals are aimed primarily at improvement of production traits However there are a number of examples where selection for high production efficiency has resulted in reduced welfare through unfavorable outcomes in health and fitness characteristics. These effects raise questions about what is ethically acceptable in animal breeding. Welfare problems may be experienced when physiological balance is disturbed by genetic selection for high production alone by a mismatch between the environmental challenges and the range of coping responses available to an animal or from a mismatch between the animal s needs and their degree of satisfaction This may be resolved by either improving the environment to support the animal but also by providing the animal through genetic selection with means to adapt to the production environment The Standing Committee of the European Convention for the Protection of Animals kept for Farming Purposes emphasizes that breeding goals should include health and welfare The Farm Animal Welfare Council pleas for a greater emphasis in breeding programs on traits associated with good welfare However although breeding goals in most farm animal species have been broadened beyond production traits to include functional traits behavioral traits are rarely included despite their potential to improve animal production and welfare It is the goal of the present Research Topic to bring together experimental and theoretical research focusing on the genetics of welfare traits and the possibility to improve animal welfare through selection This topic presents an overview of the relationship between selection for high production and livestock robustness examples of improving robustness through the introduction of novel traits in livestock breeding and a discussion on selection methods to address welfare issues The discussion on sustainability of breeding practices is very alive today and will remain to be an Foundations in Grammatical Evolution for Dynamic Environments Ian important part of the debate in the future Dempsey, Michael O'Neill, Anthony Brabazon, 2009-03-18 Dynamic environments abound encompassing many real world problems in fields as diverse as finance engineering biology and business A vibrant research literature has emerged which takes inspiration from evolutionary processes to develop problem solvers for these environments Foundations in Grammatical Evolution for Dynamic Environments is a cutting edge volume illustrating current state of the art in applying grammar based evolutionary computation to solve real world problems in dynamic environments The book provides a clear introduction to dynamic environments and the types of change that can occur This is followed by a detailed description of evolutionary computation concentrating on the powerful Grammatical Evolution methodology It continues by addressing fundamental issues facing all Evolutionary Algorithms in dynamic problems such as how to adapt and generate constants how to enhance evolvability and maintain diversity Finally the developed methods are illustrated with application to the real world dynamic
