Design Guides for Biological Wastewater Treatment Processes Joseph F. Malina, 1972 The report provides a set of guidelines for the design of biological processes for the treatment of municipal wastewater The equations and factors which must be considered in the design of the activated sludge system the contact stabilization system trickling filter plants aerated lagoons and waste stabilization ponds are identified The applicability and limitations of each system and mathematical model of each process are established Operating data from treatment plants where sufficient applicable data were recorded were used to develop rate constants and other coefficients required for application of the mathematical models and other design of treatment plants The significant design considerations are discussed design procedures are outlined and design calculations are developed

Analysis of Selected Enhancements for Soil Vapor Extraction, 1997 This report provides an engineering analysis of and status report on selected enhancements for soil vapor extraction SVE treatment technologies The report is intended to assist project managers considering an SVE treatment system by providing them with an up to date status of enhancement technologies an evaluation of each technology s applicability to various site conditions a presentation of cost and performance information a list of vendors specializing in the technologies a discussion

of relative strengths and limitations of the technologies recommendations to keep in mind when considering the enhancements and a compilation of references The performance of an SVE system depends on properties of both the contaminants and the soil SVE is generally applicable to compounds with a vapor pressure of greater than 1 millimeter of mercury at 20EC and a Henry's Law constant of greater than 100 atmospheres per mole fraction SVE is most effective at sites with relatively permeable contaminated soil and with saturated hydraulic conductivities of greater than 1×10^{-3} or 1×10^{-2} centimeter per second cm s SVE by itself does not effectively remove contaminants in saturated soil However SVE can be used as an integral part of some treatment schemes that treat both groundwater and the overlying vadose zone Enhancement technologies should be considered when contaminant or soil characteristics limit the effectiveness of SVE or when contaminants are present in saturated soil The five enhancement technologies covered in this report are as follows and are described in the following subsections Air Sparging Dual phase Extraction Directional Drilling Pneumatic and Hydraulic Fracturing Thermal Enhancement
