Selected papers from the 2nd International Symposium on UAVs, Reno, U.S.A.

June 8-10, 2009 Kimon P. Valavanis,Randal Beard,Paul Oh,Aníbal Ollero,Leslie A. Piegl,Hayong Shin,2011-04-11 In the last

decade significant changes have occurred in the field of vehicle motion planning and for UAVs in particular UAV motion planning is especially difficult due to several complexities not considered by earlier planning strategies the increased importance of differential constraints atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for these problems and difficulty inherent in characterizing approximation algorithms makes it impractical to determine algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is difficult to design a guidance system let alone choose the algorithm Throughout this paper we keep in mind some of the general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration constraints and potentially the higher order differential constraints associated with the equations of motion and the objective is to guide the vehicle towards a goal through an obstacle field A UAV guidance problem is typically characterized by a three dimensional problem space limited information about the environment on board sensors with limited range speed and acceleration constraints and uncertainty in vehicle state and sensor data

Remote Sensing and Actuation Using Unmanned Vehicles Haiyang Chao, Yang Chen, 2012-08-28 Unmanned systems and robotics technologies have become very popular recently owing to their ability to replace human beings in dangerous tedious or repetitious jobs This book fills the gap in the field between research and real world applications providing scientists and engineers with essential information on how to design and employ networked unmanned vehicles for remote sensing and distributed control purposes Target scenarios include environmental or agricultural applications such as river reservoir surveillance wind profiling measurement and monitoring control of chemical leaks

Novel Haptic Cues for UAV Tele-Operation Samantha Alaimo, 2014-01-15 Outlines three case studies obstacle avoidance wind gust rejection and a combination of the two In each case Direct Haptic Aid DHA and Indirect Haptic Aid IHA systems are designed and compared against baseline performance with no haptic aid This work aims to show that IHA is a valid and promising alternative to the other approaches which fall into the DHA category
