Low Power VCO Design in CMOS Marc Tiebout, 2006-01-25 This work covers the design of CMOS fully integrated low power low phase noise voltage controlled oscillators for telecommunication or datacommunication systems The need for low power is obvious as mobile wireless telecommunications are battery operated As wireless telecommunication systems use oscillators in frequency synthesizers for frequency translation the selectivity and signal to noise ratio of receivers and transmitters depend heavily on the low phase noise performance of the implemented oscillators Datacommunication systems need low jitter the time domain equivalent of low phase noise clocks for data detection and recovery The power consumption is less critical The need for multi band and multi mode systems pushes the high integration of telecommunication systems This is offered by sub micron CMOS featuring digital exibility The recent crisis in telecommunication clearly shows that mobile hand sets became mass market high volume consumer products where low cost is of prime importance This need for low cost products livens tremendously research towards CMOS alternatives for the bipolar or BiCMOS solutions in use today

Signal Processing for Telecommunications and Multimedia Tadeusz A. Wysocki, Bahram Honary, Beata J. Wysocki, 2004-10-01 The unprecedented growth in the range of multimedia services offered these days by modern telecommunication systems has been made possible only because of the advancements in signal processing technologies and algorithms In the area of telecommunications application of signal processing allows for new generations of systems to achieve performance close to theoretical limits while in the area of multimedia signal processing the underlying technology making possible realization of such applications that not so long ago were considered just a science fiction or were not even dreamed about We all learnt to adopt those achievements very quickly but often the research enabling their introduction takes many years and a lot of efforts This book presents a group of invited contributions some of which have been based on the papers presented at the International Symposium on DSP for Communication Systems held in Coolangatta on the Gold Coast Australia in December

2003 Part 1 of the book deals with applications of signal processing to transform what we hear or see to the form that is most suitable for transmission or storage for a future retrieval The first three chapters in this part are devoted to processing of speech and other audio signals The next two chapters consider image coding and compression while the last chapter of this part describes classification of video sequences in the MPEG domain *Digest* IEEE Antennas and Propagation Society.
