Stork, 2023-11-14 **PIXELS PAINTINGS** The discussion is firmly grounded in established art historical practices such as close visual analysis and an understanding of artists working methods and real world examples demonstrate how computer assisted techniques can complement traditional approaches Dr Emilie Gordenker Director of the Van Gogh Museum The pioneering presentation of computer based image analysis of fine art forging a dialog between art scholars and the computer vision community In recent years sophisticated computer vision

graphics and artificial intelligence algorithms have proven to be increasingly powerful tools in the study of fine art. These methods, some adapted from forensic digital photography and others developed specifically for art, empower a growing number of computer-savvy art scholars, conservators, and historians to answer longstanding questions as well as provide new approaches to the interpretation of art. *Pixels Paintings* provides the first and authoritative overview of the broad range of these methods, which extend from image processing of palette marks, brush strokes, and shapes up through analysis of objects, poses, style, composition, to the computation of simple interpretations of artworks. This book stresses that computer methods for art analysis must always incorporate the cultural contexts appropriate to the art studies at hand, a blend of humanistic and scientific expertise. Describes powerful computer image analysis methods and their application to problems in the history and interpretation of fine art. Discusses some of the art historical lessons and revelations provided by the use of these methods. Clarifies the assumptions and applicability of methods and the role of cultural contexts in their use. Shows how computation can be used to analyze tens of thousands of artworks to reveal trends and anomalies that could not be found by traditional, non-computer methods. *Pixels Paintings* is essential reading for computer image analysts and graphics specialists, conservators, historians, students, psychologists, and the general public interested in the study and appreciation of art.

The Geometry of an Art Kirsti Andersen, 2008-11-23. Key Issues: Ever since the late 1970s, when Pia Holdt, a student of mine at the time, and Jed Buchwald, a colleague normally working in another field, made me aware of how fascinating the history of perspective constructions is, I have wanted to know more. My studies have resulted in the present book, in which I am mainly concerned with describing how the understanding of the geometry behind perspective developed and how and to what extent new insights within the mathematical theory of perspective influenced the way the discipline was presented in textbooks. In order to throw light on these aspects of the history of perspective, I have chosen to focus upon a number of key questions that I have divided into two groups: Questions Concerning the History of Geometrical Perspective: How did geometrical constructions of perspective images emerge? How were they understood mathematically? How did the geometrical constructions give rise to a mathematical theory of perspective? How did this theory evolve? In connection with the last question, it is natural to take up the following themes: *Making Victorian Kinetic Toys* Philip Sayer, Caroline Freeman Sayer, 1977.

Constant-Scale Natural Boundary Mapping to Reveal Global and Cosmic Processes Pamela Elizabeth Clark, Chuck Clark, 2013-09-06. Whereas conventional maps can be expressed as outward-expanding formulae with well-defined central features and relatively poorly defined edges, Constant-Scale Natural Boundary (CSNB) maps have well-defined boundaries that result from natural processes and thus allow spatial and dynamic relationships to be observed in a new way useful to understanding these processes. CSNB mapping presents a new approach to visualization that produces maps markedly different from those produced by conventional cartographic methods. In this approach, any body can be represented by a 3D coordinate system. For a regular body with its surface relatively smooth on the scale of its size, locations of features

can be represented by definite geographic grid latitude and longitude and elevation or deviation from the triaxial ellipsoid defined surface. A continuous surface on this body can be segmented into its distinctive regional terranes enclosed and their interrelationships defined by using selected morphologically identifiable relief features e.g. continental divides, plate boundaries, river or current systems. In this way, regions of distinction on a large essentially spherical body can be mapped as two-dimensional facets with their boundaries representing regional to global scale asymmetries e.g. continental crust, continental and oceanic crust on the Earth, farside original thicker crust and nearside thinner impact-punctuated crust on the Moon. In an analogous manner, an irregular object such as an asteroid with a surface that is rough on the scale of its size would be logically segmented along edges of its impact-generated faces. Bounded faces are imagined with hinges at occasional points along boundaries, resulting in a foldable shape model. Thus, bounded faces grow organically out of the most compelling natural features. Obvious boundaries control the map's extremities and peripheral regions are not dismembered or grossly distorted as in conventional map projections. 2D maps and 3D models grow out of an object's most obvious face or terrane edges instead of arbitrarily by imposing a regular grid system or using regularly shaped facets to represent an irregular surface.

Picturing Space, Displacing Bodies Lyle Massey, 2007. In *Picturing Space, Displacing Bodies*, Lyle Massey argues that we can only learn how and why certain kinds of spatial representation prevailed over others by carefully considering how Renaissance artists and theorists interpreted perspective. Combining detailed historical studies with broad theoretical and philosophical investigations, this book challenges basic assumptions about the way early modern artists and theorists represented their relationship to the visible world and how they understood these representations. By analyzing technical feats such as anamorphosis, the perspectival distortion of an object to make it viewable only from a certain angle, drawing machines, and printed diagrams, each chapter highlights the moments when perspective theorists failed to unite a singular ideal viewpoint with the artist's or viewer's viewpoint or were unsuccessful at conjoining fictive and lived space. Showing how these failures were subsequently incorporated rather than rejected by perspective theorists, the book presents an important reassessment of the standard view of Renaissance perspective. While many scholars have maintained that perspective rationalized the relationships among optics, space, and painting, *Picturing Space, Displacing Bodies* asserts instead that Renaissance and early modern theorists often revealed a disjunction between geometrical ideals and practical applications. In some cases, they not only identified but also exploited these discrepancies. This discussion of perspective shows that the painter's geometry did not always conform to the explicitly rational Cartesian formula that so many have assumed, nor did it historically unfold according to a standard account of scientific development.
