dissection today However several imaging methods have been created to allow for the observation of structures in live persons Using these methods doctors may see malignant tumours or broken bones inside a live patient The focus of physiology is on function whereas anatomy is more concerned with structure Human physiology is the scientific study of a body's structures and their chemical and physical interactions to maintain life The human body's natural propensity toward homeostasis is at the heart of most research in the field of physiology Maintaining a constant internal environment is called homeostasis in biology Observation using both the naked eye and the manipulation microscopes and measurement are all integral parts of a physiologist's toolkit However modern physiology progresses mostly via well planned laboratory studies that elucidate the roles of the numerous structures and chemical components that comprise the human body **AAG's A**
