

CONCEPTION TO BIRTH

HOW DO THE SPERM AND EGG COME TOGETHER?

A sperm cell from a man and an egg cell from a woman join together to form a new life. The sperm is able to reproduce, so the egg must be able to do the same.

The sperm develops into a tadpole-like shape. It has a tail and a head. The head is the part that can fertilize the egg. The tail is the part that can move.

After three weeks the embryo has a beating heart.

After eight weeks it begins to look like a human child.

After 102 days the baby has eyes that can blink. After 200 days - about nine months - it is a fully formed baby.

A new organ, called the placenta, forms to supply the developing embryo with everything that it needs, including oxygen and nutrients.

Every year, about half a million children are born as a result of in-vitro fertilization, or IVF. In IVF, eggs and sperm are brought together in a lab to create an embryo. This process helps people who cannot conceive a child in the typical way.

Sometimes, a fertilized egg splits into two, forming identical twins. This is rare. It splits into three, creating identical triplets.

If two eggs are released at the same time and both are fertilized by sperm, the result is non-identical twins. The DNA of non-identical twins has more in common than the DNA of other brothers and sisters.
