Dahiya, 2006-08 **Almost Global Solutions of Capillary-Gravity Water Waves Equations on the Circle** Massimiliano Berti, Jean-Marc Delort, 2018-11-02 The goal of this monograph is to prove that any solution of the Cauchy problem for the capillary gravity water waves equations in one space dimension with periodic even in space small and smooth enough initial data is almost globally defined in time on Sobolev spaces provided the gravity capillarity parameters are taken outside an exceptional subset of zero measure In contrast to the many results known for these equations on the real line with decaying Cauchy data one cannot make use of dispersive properties of the linear flow Instead a normal forms based procedure is used eliminating those contributions to the Sobolev energy that are of lower degree of homogeneity in the solution Since the water waves equations form a quasi linear system the usual normal forms approaches would face the well known problem of losses of derivatives in the unbounded transformations To overcome this after a parilinearization of the capillary gravity water waves equations we perform several paradifferential reductions to obtain a diagonal system with constant coefficient symbols up to smoothing remainders Then we start with a normal form procedure where the small divisors are compensated by the previous paradifferential regularization The reversible structure of the water waves equations and the fact that we seek

solutions even in space guarantees a key cancellation which prevents the growth of the Sobolev norms of the solutions
