

Problem 4: Daily log returns of American Express stock from 1999 to 2008.

- Skewness: test-statistic is $t = -0.336/\sqrt{6/2515} = -6.888$ with p value 5.66×10^{-12} . Thus, we reject the null hypothesis of no skewness at the 5% level.
- Kurtosis: test-statistic is $t = \frac{6.486}{\sqrt{24/2515}} = 66.40$, which is large and has a p value close to zero. Thus, we reject the null hypothesis of zero excess kurtosis. That is, the distribution of the log returns has heavy tails.

Problem 5: Summary statistics for daily foreign exchange rates from January 4, 2000 to March 27, 2009.

Currency	mean	Variance	Skew	Ex. Kurt.	Min.	Max.
Percentage log returns: 2322 data points						
CA	-0.0068	0.345	-0.239	8.245	-5.072	3.807
EU	0.011	0.428	0.126	2.805	-3.003	4.621
JP	-0.002	0.440	-0.671	4.581	-5.216	2.708
UK	-0.006	0.382	-0.395	7.061	-4.966	4.435

The sample means of daily log returns of the exchange rates considered are small. The returns all have positive excess kurtosis, indicating heavy tails.

Analysis Of Financial Time Series Solutions Manual:

Analysis of Financial Time Series Ruey S. Tsay, 2010-10-26 This book provides a broad mature and systematic introduction to current financial econometric models and their applications to modeling and prediction of financial time series data. It utilizes real world examples and real financial data throughout the book to apply the models and methods described. The author begins with basic characteristics of financial time series data before covering three main topics: Analysis and application of univariate financial time series; The return series of multiple assets; Bayesian inference in finance methods. Key features of the new edition include additional coverage of modern day topics such as arbitrage, pair trading, realized volatility and credit risk modeling, a smooth transition from S Plus to R and expanded empirical financial data sets. The overall objective of the book is to provide some knowledge of financial time series, introduce some statistical tools useful for analyzing these series and gain experience in financial applications of various econometric methods. Learning and Soft Computing Vojislav Kecman, 2001 This textbook provides a thorough introduction to the field of learning from experimental data and soft computing. Support vector machines (SVM) and neural networks (NN) are the mathematical structures or models that underlie learning, while fuzzy logic systems (FLS) enable us to embed structured human knowledge into workable algorithms. The book assumes that it is not only useful but necessary to treat SVM, NN and FLS as parts of a connected whole. Throughout the theory and algorithms are illustrated by practical examples as well as by problem sets and simulated experiments. This approach enables the reader to develop SVM, NN and FLS in addition to understanding them. The book also presents three case studies on NN based control, financial time series analysis and computer graphics. A solutions manual and all of the MATLAB programs needed for the simulated experiments are available. *Python for Finance* Dmytro Zherlitsyn, 2024-07-30 DESCRIPTION Python's intuitive syntax and beginner friendly nature makes it an ideal programming language for financial professionals.
