Development, Disease, Repair and Regeneration Melissa Helen Little,2015-08-06 Kidney Development Disease Repair and Regeneration focuses on the molecular and cellular basis of kidney development exploring the origins of kidney lineages the development of kidney tissue subcompartments as well as the genetic and environmental regulation of kidney development Special coverage is given to kidney stem cells and possible steps towards kidney repair and regeneration Emphasis is placed on the fetal origins of postnatal renal disease and our current understanding of the molecular basis of damage and repair Biomedical researchers across experimental nephrology and developmental biology will find this a key reference for learning how the underlying developmental mechanisms of the kidney will lead to greater advances in regenerative medicine within nephrology Offers researchers a single comprehensive resource written by leaders from both the developmental biology and the experimental nephrology communities Focuses on understanding the molecular basis of

organogenesis in the kidney as well as how this can be affected both genetically and environmentally Explains the underlying developmental mechanisms which influence the kidney's inherent repair capacity Demonstrates how a deeper understanding of mechanisms will lead to greater advances in regenerative medicine Recent Progress in Understanding the Mechanism and Consequences of Retrotransposon Movement David J. Garfinkel, Katarzyna J. Purzycka, 2018-07-10 This book is a printed edition of the Special Issue Recent Progress in Understanding the Mechanism and Consequences of Retrotransposon Movement that was published in *Viruses* *Tissue Engineering in Regenerative Medicine* Harold S. Bernstein, 2011-08-28 Over the past decade significant advances in the fields of stem cell biology bioengineering and animal models have converged on the discipline of regenerative medicine Significant progress has been made leading from pre clinical studies through phase 3 clinical trials for some therapies This volume provides a state of the art report on tissue engineering toward the goals of tissue and organ restoration and regeneration Examples from different organ systems illustrate progress with growth factors to assist in tissue remodeling the capacity of stem cells for restoring damaged tissues novel synthetic biomaterials to facilitate cell therapy transplantable tissue patches that preserve three dimensional structure synthetic organs generated in culture aspects of the immune response to transplanted cells and materials and suitable animal models for non human clinical trials The chapters of this book are organized into six sections Stem Cells Biomaterials and the Extracellular Environment Engineered Tissue Synthetic Organs Immune Response and Animal Models Each section is intended to build upon information presented in the previous chapters and set the stage for subsequent sections Throughout the chapters the reader will observe a common theme of basic discovery informing clinical translation and clinical studies in animals and humans guiding subsequent experiments at the bench **mTOR Signaling in Metabolism and Cancer** Shile Huang, 2020-12-03 The mechanistic mammalian target of rapamycin mTOR a serine threonine kinase is a central regulator for human physiological activity Deregulated mTOR signaling is implicated in a variety of disorders such as cancer obesity diabetes and neurodegenerative diseases The papers published in this Special Issue summarize the current understanding of the mTOR pathway and its role in the regulation of tissue regeneration regulatory T cell differentiation and function and different types of cancer including hematologic malignancies skin prostate breast and head and neck cancer The findings highlight that targeting mTOR pathway is a promising strategy to fight against certain human diseases **Current Insights Into LAMA2 Disease** Stefano Carlo Previtali, Markus A. Stem Cells and Progenitor Cells in Ischemic Stroke - Fashion or Future? Thorsten R. Doeppner, Dirk M. Hermann, 2016-01-15

Stroke remains one of the most devastating diseases in industrialized countries Recanalization of the occluded arterial vessel using thrombolysis is the only causal therapy available However thrombolysis is limited due to severe side effects and a limited time window As such only a minority of patients receives this kind of therapy showing a need for new and innovative treatment strategies Although neuroprotective drugs have been shown to be beneficial in a variety of experimental stroke models they ultimately failed in clinical trials Consequently recent scientific focus has been put on modulation of post ischemic neuroregeneration either via stimulation of endogenous neurogenesis or via application of exogenous stem cells or progenitor cells Neurogenesis persists within the adult brain of both rodents and primates As such neural progenitor cells NPCs are found within distinct niches like the subventricular zone SVZ of the lateral ventricles and the subgranular zone of the dentate gyrus Cerebral ischemia stimulates these astrocyte like progenitor cells upon which NPCs proliferate and migrate towards the site of lesion There NPCs partly differentiate into mature neurons without significantly being integrated into the residing neural network Rather the majority of new born cells dies within the first weeks post stroke leaving post ischemic neurogenesis a phenomenon of unknown biological significance Since NPCs do not replace lost brain tissue beneficial effects observed in some studies after either stimulated or protected neurogenesis are generally contributed to indirect effects of these new born cells The precise identification of appropriated cellular mediators however is still elusive How do these mediators work Are they soluble factors or maybe even vesicular structures emanating from NPCs What are the cues that guide NPCs towards the ischemic lesion site How can post ischemic neurogenesis be stimulated How can the poor survival of NPCs be increased In order to support post ischemic neurogenesis a variety of research groups have focused on application of exogenous stem progenitor cells from various tissue sources Among these cultivated NPCs from the SVZ and mesenchymal stem cells MSCs from the bone marrow are frequently administered after induction of stroke Although neuroprotection after delivery of stem progenitor cells has been shown in various experimental stroke models transplanted cells are usually not integrated in the neural network Again the vast amount of grafted cells dies or does not reach its target despite profound neuroprotection also suggesting indirect paracrine effects as the cause of neuroprotection Yet the factors being responsible for these observations are under debate and still have to be addressed Is there any optimal cell type for transplantation How can the resistance of grafted cells against a non favorable extracellular milieu be increased What are the molecules that are vital for interaction between grafted cells and endogenous NPCs The present research topic seeks to answer at least in part some of the aforementioned questions Although the research topic predominantly focuses on

experimental studies and reviews alike a current outlook towards clinical relevance is given as well
