Design of Very High-Frequency Multirate Switched-Capacitor Circuits Seng-Pan U,Rui Paulo Martins,José Epifânio da Franca,2006 Design of Very High Frequency Multirate Switched Capacitor Circuits presents the theory and the

corresponding CMOS implementation of the novel multirate sampled data analog interpolation technique which has its great potential on very high frequency analog front end filtering due to its inherent dual advantage of reducing the speed of data converters and DSP core together with the specification relaxation of the post continuous time filtering. This technique completely eliminates the traditional phenomenon of sampled and hold frequency shaping at the lower input sampling rate. Also in order to tackle physical IC imperfections at very high frequency the state of the art circuit design and layout techniques for high speed Switched Capacitor SC circuits are comprehensively discussed. Optimum circuit architecture tradeoff analysis. Simple speed and power trade off analysis of active elements. High order filtering response accuracy with respect to capacitor ratio mismatches. Time interleaved effect with respect to gain and offset mismatch. Time interleaved effect with respect to timing skew and random jitter with non uniformly holding. Stage noise analysis and allocation scheme. Substrate and supply noise reduction. Gain and offset compensation techniques. High bandwidth low power amplifier design and layout. Very low timing skew multiphase generation. Two tailor made optimum design examples in CMOS are presented. The first one achieves a 3 stage 8 fold SC interpolating filter with 5.5MHz bandwidth and 108MHz output sampling rate for a NTSC PAL CCIR 601 digital video at 3 V. Another is a 15 tap 57MHz SC FIR bandpass interpolating filter with 4 fold sampling rate increase to 320MHz and the first time embedded frequency band up translation for DDFS system at 2.5V. The corresponding chip prototype achieves so far the highest operating frequency, highest filter order and highest center frequency with highest dynamic range under the lowest supply voltage when compared to the previously reported high frequency SC filters in CMOS.

Semiconductor devices- Theory concepts and applications M. Sameh Said, 2012-01-02 Basic Semiconductor devices Theory concepts and applications Introduction to Linear Circuit Analysis and Modelling Luis Moura, Izzat Darwazeh, 2005-03-05

Luis Moura and Izzat Darwazeh introduce linear circuit modelling and analysis applied to both electrical and electronic circuits starting with DC and progressing up to RF considering noise analysis along the way Avoiding the tendency of current textbooks to focus either on the basic electrical circuit analysis theory DC and low frequency AC frequency range on RF circuit analysis theory or on noise analysis the authors combine these subjects into the one volume to provide a comprehensive set of the main techniques for the analysis of electric circuits in these areas Taking the subject from a modelling angle this text brings together the most common and traditional circuit analysis techniques e g phasor analysis

with system and signal theory e.g. the concept of system and transfer function so students can apply the theory for analysis as well as modelling of noise in a broad range of electronic circuits. A highly student focused text each chapter contains exercises, worked examples and end of chapter problems with an additional glossary and bibliography for reference. A balance between concepts and applications is maintained throughout. Luis Moura is a Lecturer in Electronics at the University of Algarve. Izzat Darwazeh is Senior Lecturer in Telecommunications at University College London, previously at UMIST. An innovative approach fully integrates the topics of electrical and RF circuits and noise analysis with circuit modelling. Highly student focused, the text includes exercises and worked examples throughout along with end of chapter problems to put theory into practice.

Ultra Wideband Ranjit Gharpurey,Peter Kinget,2008-03-06 Recent

advances in wireless communication technologies have had a transformative impact on society and have directly contributed to several economic and social aspects of daily life. Increasingly the untethered exchange of information between devices is becoming a prime requirement for further progress which is placing an ever greater demand on wireless bandwidth. The ultra wideband UWB system marks a major milestone in this progress. Since 2002 when the FCC allowed the unlicensed use of low power UWB radio signals in the 3.1-10.6GHz frequency band there has been significant synergistic advance in this technology at the circuits architectural and communication systems levels. This technology allows for devices to communicate wirelessly while coexisting with other users by ensuring that its power density is sufficiently low so that it is perceived as noise to other users. UWB is expected to address existing needs for high data rate short range communication applications between devices such as computers and peripherals or consumer electronic devices. In the long term it makes available spectrum to permit with new signaling formats such as those based on very short pulses of radio frequency RF energy. As such it represents an opportunity to design fundamentally different wireless systems which rely on the bandwidth of the signals to enhance the data rate or which use the available bandwidth for diverse applications such as ranging and biomedical instrumentation.

Analysis and Design of Analog Integrated Circuits Paul R. Gray, 2001 *CMOS Low Noise Amplifiers for Single and Multiband Applications: A Comprehensive Design Approach* Norlaili Mohd Noh, Farshad Eshghabadi, Arjuna Marzuki, 2023-10-11 This book provides comprehensive knowledge aimed at practicing integrated circuit design engineer or researcher to learn and design a low noise amplifier LNA for single and multiband applications. The content is structured in a way so that even a beginner can follow the design method easily. This book features the following characteristics: different types of LNA designs with key building blocks are discussed and detailed analysis is given for each LNA design which covers from the fundamental and principal knowledge to the justification of the design approach. Detailed design approaches are using 180 nm and 130nm CMOS technologies purposely presented in this manner to give exposure to the design of LNA under different technologies. The LNAs in this book are designed for GSM WCDMA and WLAN standards but the same method can be used for other frequencies of operation. Comprehensive analyses on the extreme or corner condition effects are highlighted. Besides detailed derivation of equations relating to the parameters of the LNA, performance metrics help LNA designers in understanding how the performance metrics of the LNA can be optimized to meet the desired specification. Electromagnetic analyses using Sonnet an electromagnetic tool able to replace the conventional post layout simulation with resistance and capacitance parasitic extraction for more accurate frequency performance prediction are presented. The electromagnetic method is proposed to be used in the LNA design as it can accurately predict the LNA's performance before tape out for first pass fabrication. MATLAB codes are provided to generate important S parameters and noise figure values.
