

The Digestive System

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is used to break down food into nutrients that can be absorbed by the body. The digestive system is a complex system that includes the mouth, salivary glands, stomach, small intestine, large intestine, and rectum. The digestive system is a continuous system that starts in the mouth and ends in the rectum.

Liver, pancreas & gallbladder

The liver, pancreas, and gallbladder are accessory organs of the digestive system. The liver is the largest organ in the body and is responsible for producing bile, which is stored in the gallbladder. The pancreas is a small organ that is located behind the stomach and is responsible for producing pancreatic juice, which is used to break down food in the small intestine.

Layers of large intestine

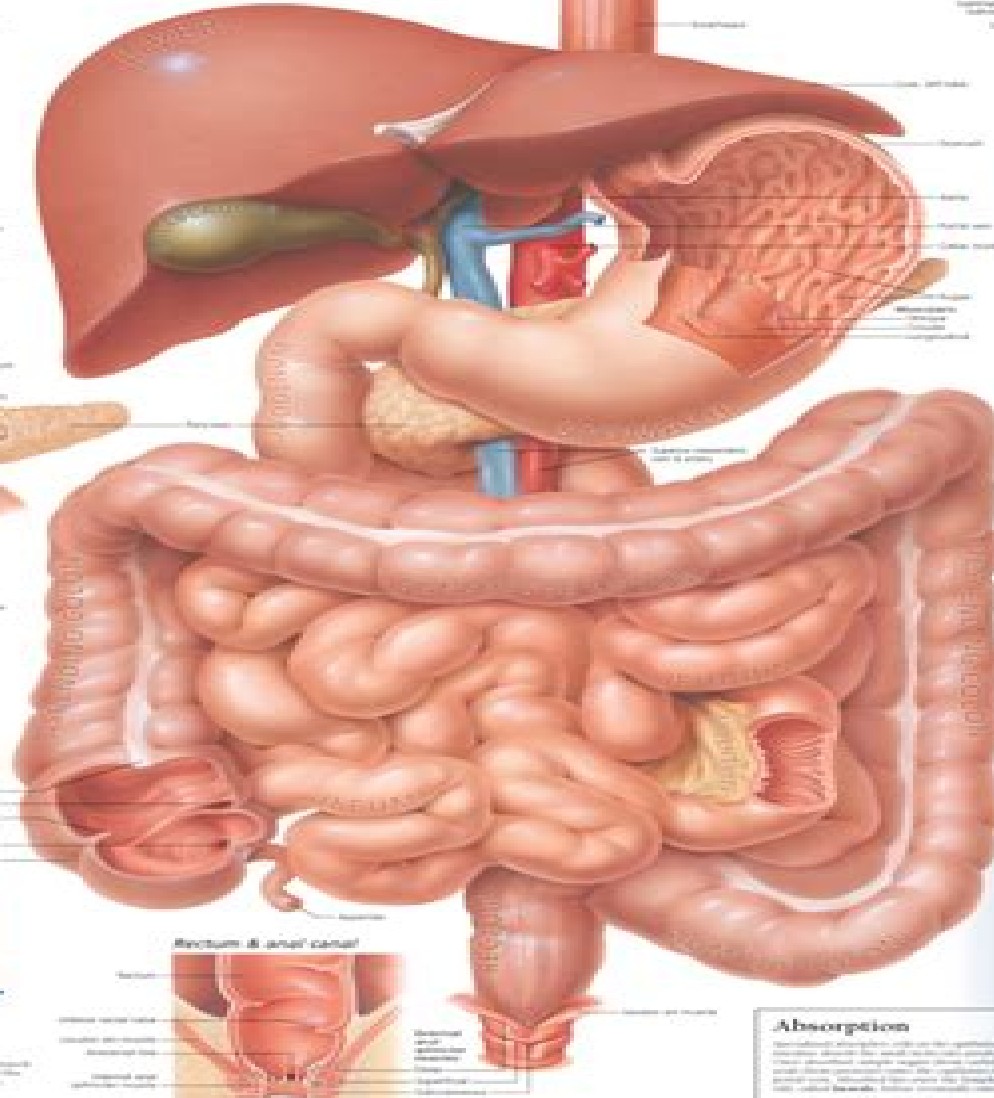

Large intestine

The large intestine is the final part of the digestive system. It is responsible for absorbing water and electrolytes from the remaining indigestible food matter. The large intestine is a large, sac-like organ that is located in the lower right and left sides of the abdomen.

Peristaltic action

Peristaltic action is the process by which the digestive system moves food through the tract. It is a series of involuntary contractions of the muscles of the digestive tract that push food forward.

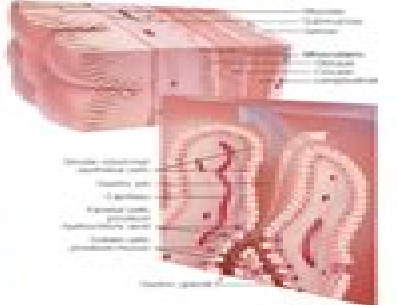

The mouth & salivary glands

The mouth is the starting point of the digestive system. It is where food is taken in and broken down into smaller pieces. The salivary glands are located in the mouth and produce saliva, which is used to break down food into smaller pieces.

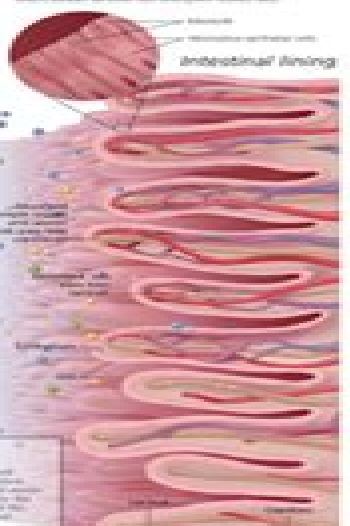

The stomach

The stomach is a large, sac-like organ that is located in the upper left side of the abdomen. It is responsible for breaking down food into smaller pieces and mixing it with gastric juice. The stomach is a muscular organ that can expand to hold a large amount of food.

Small intestine

The small intestine is a long, coiled organ that is located in the upper right side of the abdomen. It is responsible for breaking down food into smaller pieces and absorbing nutrients. The small intestine is a long, thin organ that is about 6 meters long.

Absorption

Absorption is the process by which nutrients are taken up by the body. It occurs in the small intestine, where nutrients are broken down into smaller pieces and absorbed into the bloodstream.
