

Chapter 1 The Human Body: An Orientation

Most of us are naturally curious about our bodies; we want to know what makes us tick. This curiosity is even seen in infants, who can keep themselves happy for a long time staring at their own hands or pulling their mother's nose. Older children wonder where food goes when they swallow it, and some believe that they will grow a watermelon in their belly if they swallow the seeds. They scream loudly when approached by medical personnel (fearing shots that sting), but they like to play doctor. Adults become upset when their hearts pound, when they have uncontrollable hot flashes, or when they cannot keep their weight down.

Anatomy and physiology, subdivisions of biology, explore many of these topics as they describe how our bodies are put together and how they work.

An Overview of Anatomy and Physiology

- Define *anatomy* and *physiology*.
 - **Anatomy** – the study of the structures and shape of the body and body parts and their relationship to one another
 - **Physiology** – the study of how the body and its parts work or function
- Explain how anatomy and physiology are related.
 - Always related – structure determines function

Levels of Structural Organization

- Name the levels of structural organization that make up the human body and explain how they are related.
 - Atoms – molecules – cells – tissues – organs – organ systems – organisms
 - Each level is more complex than the previous
- Name the organ systems of the body and briefly state the major functions of each system.
 - **Integumentary** – external covering of the body – skin – waterproofs the body, cushions, protects deeper tissues, excretes salts and urea in perspiration to regulate temperature
 - **Skeletal** – bones, cartilage, ligaments, joints – support, framework for skeletal muscles, protection, formation of blood cells, storehouse for minerals
 - **Muscular** – shorten or contract – movements inside and out of the body
 - **Nervous** – brain, spinal cord, nerves, sensory receptors – allow us to respond to stimuli inside and outside the body
 - **Endocrine** – hormones released from glands into the blood to target organs – control body's activities at a slower rate than nervous
 - **Cardiovascular** – heart and blood vessels – carries oxygen, nutrients, hormones, and other stuff, protect from foreign invaders
 - **Lymphatic** – lymphatic vessels, lymph nodes, spleen, tonsils – return fluid leaked from blood vessels to the blood vessels, cleanse the blood and house immune cells
 - **Respiratory** – keep body constantly supplied with oxygen and remove carbon dioxide – gas exchange
 - **Digestive** – break down food and deliver the products to the blood for dispersal to the body cells
 - **Urinary** – removes the nitrogen-containing wastes from the blood and flushes them from the body in urine – A.K.A. excretory system
 - **Reproductive** – produce offspring
- Classify by organ system all organs discussed.
 - See pages 5 – 6
- Identify the organs shown on a diagram or a dissectible torso.

The Waterside Ape Peter H. Rhys Evans, 2019-07-24 Why are humans so fond of water Why is our skin colour so variable Why aren't we hairy like our close ape relatives A savannah scenario of human evolution has been widely accepted primarily due to fossil evidence and fossils do not offer insight into these questions Other alternative evolutionary scenarios might but these models have been rejected This book explores a controversial idea that human evolution was intimately associated with watery habitats as much or more than typical savannahs Written from a medical point of view the author presents evidence supporting a credible alternative explanation for how humans diverged from our primate ancestors Anatomical and physiological evidence offer insight into hairlessness different coloured skin subcutaneous fat large brains a marine type kidney a unique heat regulation system and speech This evidence suggests that humans may well have evolved not just as savannah mammals as is generally believed but with more affinity for aquatic habitats rivers

streams lakes and coasts Key Features Presents the evidence for a close association between riparian habitats and the origin of humans Reviews the savannah ape hypothesis for human origins Describes various anatomical adaptations that are associated with hypotheses of human evolution Explores characteristics from the head and neck such as skull and sinus structures the larynx and ear structures and functions Corroborates a novel scenario for the origin of human kind a counterpoint to the textbooks or other books which deal with human evolution I think readers will see it as a clearly written well supported discussion of an alternative perspective on human origins Kathlyn Stewart Canadian Museum of Nature Ottawa There is a pressing need to expand discussions of human evolution to include non anthropocentric narratives that use comparative data Dr Rhys Evans specific expertise and experience with the human head neck ears throat mouth and sinuses provides him with a distinct perspective from which to approach the subject of human evolution Moreover his understanding of non anthropocentric views of human evolution water based models allow him to apply a biological approach to the subject missing in more traditional savannah based models Stephen Munro National Museum of Australia
