Microorganisms are important participants in supporting the functionality and diversity of terrestrial ecosystems. The microbial community is a key component that determines the structure, function, and complex processes of terrestrial ecosystems. The patterns and mechanisms of microbial community structure and function with respect to geographical scales and environmental changes have always been a focal and hot topic in environmental microbiology, ecology, and geography research. However, with the intensification of climate change and changes caused by other human activities, the ability of terrestrial ecosystems to withstand disturbances and maintain their functionality is increasingly being put to the test. The role and changes of terrestrial ecosystem microorganisms in addressing this issue have become a global focus and challenge for research.

In different parts of the world, over 50 species of these special economic animals are reared for commercial purposes and as a valuable food resource. These include a variety of special breeds of livestock and poultry such as sika deer, red deer, yak, silky chickens, pigeons, and ostriches. Fur animals like fox, raccoon dog, and mink are raised for their pelts, while rare birds, honeybees, and silkworms are bred for their unique contributions. Additionally, other valuable insects such as the black soldier fly also hold significance within the realm of special economic animals. However, the special economic animal industry faces complex pressures and challenges.
