The Elbow is a complex hinge type of Synovial joint formed between the distal end of the Humerus and the proximal ends of the Ulna and Radius in the Forearm which allows extension and flexion in relation to the upper arm and rotation of the forearm. The major muscles of the Elbow are: the **Biceps Brachii**, who's action is to flex the Elbow and supinate the Forearm. The **Triceps Brachii**, the main extensor of the Elbow. The **Brachioradialis**, who's action is to flex the Elbow and add pronation and supination. The **Pronator Teres**, who's action is to add flexion and pronate the Forearm. The **Extensor Carpi Radialis Brevis**, who's action is to extend the Wrist and add extension of the Elbow. As with all synovial joints, a smooth, low friction layer of **Articular Cartilage** covers the ends of the bones providing a lubricated surface for articulation and facilitating the transmission of loads. The Elbow is inherently a stable joint supported by the **Ulnar Collateral Ligament**, the **Radial Collateral Ligament** and the **Annular Ligament**.

Anatomy Of The Elbow Joint:

Biomechanics of Joints and Implants Sanjay Gupta, Ceby Mullakkara Saviour, Bidyut Pal, Souptick Chanda, Kaushik Mukherjee, 2025-07-01 This textbook serves as a comprehensive resource for readers interested in applying the principles of engineering mechanics to analyse the mechanical and structural functions of the musculoskeletal system. Over the past few decades, orthopaedic practice has strongly been influenced by the contributions from mechanical analysis and design. This book sequentially presents basic concepts and applications necessary for understanding a biomechanical system. The book is specially focussed on analysis and design of orthopaedic implants used to treat skeletal diseases and disorders. The book begins with an introduction to the anatomy, physiology and movements of human body and its mechanical analogy, followed by chapters on basic biomechanics of various joints and spine. It elaborately discusses the gait analysis and measurement techniques and systematically presents the quantitative estimation of musculoskeletal forces, joint forces and moments, muscle forces using the fundamental concepts of joint dynamics, kinematics and kinetics with relevant solved examples and exercises to impart basic understanding and knowledge to the students. It also discusses the basic concepts of mechanics of deformable bodies relevant for bone tissue as well as implanted bone structure, common failure mechanisms of implanted bone structure and biomaterials used in orthopaedic implants and the steps involved in finite element modelling and analysis of implant bone structures. Other topics covered include various theories, mathematical formulations, the computational framework of bone remodelling and bone ingrowth, mechanobiology based mathematical models of tissue differentiation and simulations on tissue ingrowth have been presented along with the outcomes of our research activities which may help and inspire the students to pursue research in this field.
