

Analysis of a Squirrel Gene Pool

Suppose that, after a natural disaster, a small population of 2000 squirrels was left behind. Between 1970 and 1990, they existed as three distinct colors: brown, white, and grey. At the beginning, there were 1000 of each, or 33% of each color. Suppose that natural selection favored white squirrels at a rate dependent on the color of the surrounding vegetation. The data below should be consistent with the natural selection and Hardy-Weinberg equilibrium assumptions. Assume that the population is sufficiently large to ignore genetic drift, and that the population is isolated from other squirrel populations.

Suppose that the population was in Hardy-Weinberg equilibrium in 1970.
