Human Anatomy and Physiology / As Per PCI - ER 2020 Dr. Naveen Garg, Dr. Sanwar Mal Yadav, Ms. Shweta Bhandari, Mr. Vipin Kumar Singhal, 2023-03-27 The scientific study of the human body's structures is known as anatomy. Some of such structures are quite tiny, making the use of the microscope essential for their examination. It is simple to see, handle, measure, and weigh other bigger structures. The Greek origin of the word for anatomy implies to cut apart. Human anatomy was first studied by looking at people's scars and other external signs of injury. Later on, doctors were

permitted to learn more by dissecting human corpses Dissection is the process of separating parts of a body so that their individual properties and connections may be studied Medical schools anatomy classes and pathology laboratories all make use of dissection today However several imaging methods have been created to allow for the observation of structures in live persons Using these methods doctors may see malignant tumours or broken bones inside a live patient The focus of physiology is on function whereas anatomy is more concerned with structure Human physiology is the scientific study of a body's structures and their chemical and physical interactions to maintain life The human body's natural propensity toward homeostasis is at the heart of most research in the field of physiology Maintaining a constant internal environment is called homeostasis in biology Observation using both the naked eye and the manipulation microscopes and measurement are all integral parts of a physiologist's toolkit However modern physiology progresses mostly via well planned laboratory studies that elucidate the roles of the numerous structures and chemical components that comprise the human body **The Ear:**
