Abstract The authors examined the effects of a 12-week, 1000 kcal energy deficit diet on the body composition and metabolic profile of 10 obese women. The diet was composed of 25% protein, 40% carbohydrate, and 35% fat. The subjects lost 10.5% of their initial body weight, 10.5% of their initial fat mass, and 10.5% of their initial lean mass. The diet was well tolerated, and the subjects maintained a high level of physical activity throughout the study. The authors conclude that a 12-week, 1000 kcal energy deficit diet is an effective means of achieving weight loss in obese women.

1. **Model:** $y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k + \epsilon$
 2. **Assumptions:**
 a. Linearity: The relationship between the independent variables and the dependent variable is linear.
 b. Independence: The error terms are independent of each other.
 c. Homoscedasticity: The variance of the error terms is constant across all levels of the independent variables.
 d. Normality: The error terms are normally distributed.
 e. No multicollinearity: The independent variables are not highly correlated with each other.
 3. **Estimation:** The parameters $\beta_0, \beta_1, \dots, \beta_k$ are estimated using the method of least squares, which minimizes the sum of the squared residuals.
 4. **Interpretation:** The coefficients $\beta_1, \beta_2, \dots, \beta_k$ represent the change in the dependent variable y for a one-unit change in the corresponding independent variable x_i , holding all other variables constant.
 5. **Model Fit:** The coefficient of determination R^2 measures the proportion of the variance in the dependent variable that is explained by the independent variables in the model.
 6. **Model Validation:** The model's performance is evaluated using various metrics, such as the mean squared error (MSE) and the adjusted R^2 , to assess its predictive accuracy and generalizability.
