V. Klapdor-Kleingrothaus, 2001 Nuclear double beta decay is one of the most promising tools for probing beyond the standard model physics on beyond accelerator energy scales It is already now probing the TeV scale on which new physics should manifest itself according to theoretical expectations Only in the early 1980s was it known that double beta decay yields information on the Majorana mass of the exchanged neutrino At present the sharpest bound for the electron neutrino mass arises from this process It is only in the last 10 years that the much more far reaching potential of double beta decay has been discovered Today the potential of double beta decay includes a broad range of topics that are equally relevant to particle physics and astrophysics such as masses of heavy neutrinos of sneutrinos as SUSY models compositeness leptoquarks left right symmetric models and tests of Lorentz symmetry and equivalence principle in
