Modularity in Motor Control: From Muscle Synergies to Cognitive Action Representation Andrea d'Avella, Martin Giese, Yuri P Ivanenko, Thomas Schack, Tamar Flash, 2016-04-21 Mastering a rich repertoire of motor behaviors as humans and other animals do is a surprising and still poorly understood outcome of evolution development and learning Many degrees of freedom non linear dynamics and sensory delays provide formidable challenges for controlling even simple actions Modularity as a functional element both structural and computational of a control architecture might be the key organizational principle that the central nervous system employs for achieving versatility and adaptability in motor control Recent investigations of muscle synergies motor primitives compositionality basic action concepts and related work in machine learning have contributed to advance at different levels our understanding of the modular architecture underlying rich motor behaviors However the existence and nature of the modules in the control architecture is far from settled For instance regularity and low dimensionality in the motor output are often taken as an indication of modularity but could they simply be a byproduct of optimization and task constraints Moreover what are the relationships between modules at different levels such as muscle synergies kinematic invariants and basic action concepts One important reason for the new interest in understanding modularity in motor control from different viewpoints is the impressive development in cognitive robotics In comparison to animals and humans the motor skills of today's best robots are limited and inflexible However robot technology is maturing to the point at which it can start approximating a reasonable spectrum of isolated perceptual cognitive and motor capabilities These advances allow researchers to explore how these motor sensory and cognitive functions might be integrated into meaningful architectures and to test their functional limits Such systems provide a new test bed to explore different concepts of modularity and to address the interaction between motor and cognitive processes experimentally Thus the goal of this Research Topic is to review compare and debate theoretical and experimental investigations of the modular organization of the motor control system at different levels By bringing together researchers seeking to understand the building blocks for coordinating many muscles for planning endpoint and joint trajectories and for representing motor and behavioral actions in memory we aim at promoting new interactions between often disconnected research areas and approaches and at providing a broad perspective on the idea of modularity in motor control We welcome original research methodological theoretical review and perspective contributions from behavioral system and computational motor neuroscience research cognitive psychology and cognitive robotics

Plant Abiotic Stress Tolerance Mirza Hasanuzzaman, Khalid Rehman Hakeem, Kamrun Nahar, Hesham F. Alharby, 2019-04-04 Plants have to manage a series of environmental stresses throughout their entire lifespan Among these abiotic stress is the most detrimental one that is responsible for nearly 50% of crop yield reduction and appears to be a potential threat to global food security in coming decades Plant growth and development reduces drastically due to adverse effects of abiotic stresses It has been estimated that crop can exhibit only 30% of their genetic potentiality under abiotic stress condition So this is a fundamental need to understand the stress responses to facilitate breeders to develop stress resistant and stress tolerant cultivars along with good management practices to withstand abiotic stresses Also a holistic approach to understanding the molecular and biochemical interactions of plants is important to implement the knowledge of resistance mechanisms under abiotic stresses Agronomic practices like selecting cultivars that is tolerant to wide range of climatic condition planting date irrigation scheduling fertilizer management could be some of the effective short term adaptive tools to fight against abiotic stresses In addition system biology and omics approaches in recent studies offer a long term opportunity at the molecular level in dealing with abiotic stresses The genetic approach for example selection and identification of major conditioning genes by linkage mapping and quantitative trait loci QTL production of mutant genes and transgenic introduction of novel genes has imparted some tolerant characteristics in crop varieties from their wild ancestors Recently research has revealed the interactions between micro RNAs miRNAs and plant stress responses exposed to salinity freezing stress and dehydration Accordingly transgenic approaches to generate stress tolerant plant are one of the most interesting researches to date This book presents the recent development of agronomic and molecular approaches in conferring plant abiotic stress tolerance in an organized way The present volume will be of great interest among research students and teaching community and can also be used as reference material by professional researchers
