Acinetobacter: From Drug Resistance to Pathogenesis Ghassan M. Matar, 2018-05-03 Pseudomonas aeruginosa and
Acinetobacter baumannii are among the most common non lactose fermenting Gram negative pathogens responsible for
hospital acquired infections especially in intensive care units ICUs The treatment of infections caused by these bacteria is
complicated due to the emergence of multi drug resistance as the two species are noted for their intrinsic resistance to
antimicrobial agents and their ability to acquire genetic elements that encode for resistance determinants In both species
resistance to multiple classes of antimicrobial agents can seriously compromise the ability to treat infected patients
especially the immunocompromised Consequently very few antimicrobials remain as treatment options Mechanisms of
resistance in both of these pathogens include the production of lactamases and aminoglycoside modifying enzymes as well as
reduced or lack of expression of outer membrane proteins mutations in topoisomerases and up regulation of efflux pumps To
that purpose the findings of the studies included in this book deal with the prevalence of resistant isolates to various
antimicrobial agents in both P aeruginosa and A baumannii their underlying mechanisms of resistance their virulence factors
their pathogenesis and prospective treatment options Special thanks are due to Mr Bassam El Hafi for facilitating procedures
