

Surface Weather Map Showing Storm System in the Eastern United States

Figure 2. Simplified surface weather map showing a storm system in the eastern US.

Warm air advection occurs where the wind flows across isobars from higher pressure to lower (warmer) values. Thus, warm air is being transported across a certain location by the horizontal winds. Based on this fact alone, one would expect precipitation at that location to be rising, cold air advection occurs where the wind flows across the isobars from lower (colder) values to higher (warmer) values. Thus, colder air being transported by the wind to a certain location produces falling temperatures.

Based on wind directions and the isobars pattern on the Figure 2 map, determine the type of air advection (warm or cold) that would be occurring at each station.

3. Winds at station A are occurring at Station _____.

- ☐ A
- ☐ B
- ☐ C

4. Could air advection occur occurring at Station _____.

- ☐ B
- ☐ C
- ☐ D

5. Generalizing from the map depiction of wind and isobars, pressure associated with weather systems, what is the most likely weather expected at Station _____.

- ☐ warm
- ☐ cold

6. Meanwhile, what is the most likely weather expected to form _____ air advection.

- ☐ warm
- ☐ cold

7. Areas to the east of Highs would be expected to have _____ air advection.
