

Categories of corals

Acroporids: those that grow bushy, soft corals they are flexible and do not create coral skeletons. Look like plants, trees or fans. Generally do not have a symbiotic relationship with zooxanthellae.
Examples: sea anemones, sea fans, gorgonians

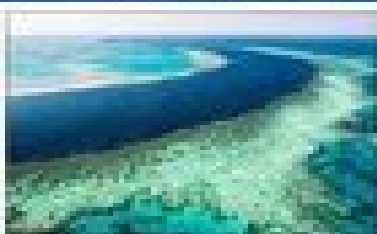

Scleractinia: those that produce very hard corals built on calcium and MGS. Includes suborder Scleractinia.
Colonies begin when a polypoidal coral larva lands on a hard substrate.
Once attached it begins to change into a polyp.
If it survives it will reproduce asexually in a process called budding, direct clone of itself. A coral colony has the same DNA as the parent founder.
Corals cement themselves to the substrate by secreting calcium carbonate.
If a coral dies another will grow in its place and add another layer of CaCO₃. Eventually this creates mounds and all the layering can cause a variety of coral shapes.

Barrier Reefs

- Similar to fringing reef because it is near the shoreline of a larger landmass.
- Barrier reefs are separated by a BARREN from the land. This barrier is a wide region. The reef could be up to 500m from the shore.
- Fringing reefs can exist in the region that is between the barrier reef and shoreline.
- Barrier reefs can build up on themselves raising the water dangerously shallow for boats to travel over them.

Patch reefs

- Smallest of the reef types.
- Tend to grow vertically within the regions of barrier reefs or atolls.
- Rarely have the vertical height needed to reach the water surface.
- Provide habitat for juvenile fish.

Types of Reefs: Reefs can be built by the dead, skeletal remains of coral animals. They can be built on a hard, rocky substrate or a soft, sandy substrate.

Fringing Reef

- A fringing reef is a reef that is built on a hard, rocky substrate.
- It is the most common type of reef and is found in many tropical regions.
- It is built on a hard, rocky substrate and is found in many tropical regions.
- It is built on a hard, rocky substrate and is found in many tropical regions.
- It is built on a hard, rocky substrate and is found in many tropical regions.

Importance of mangrove forests

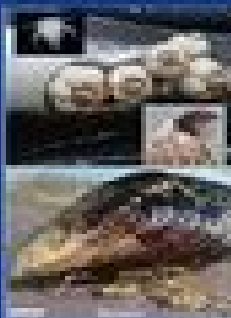

Ecological Importance

Mangrove forests are a critical part of the coastal ecosystem. They provide a natural barrier against storms and tsunamis, and they help to filter pollutants from the water.

Mangrove forests are also important for the local economy. They provide a source of food and medicine for the people who live in the area.

Human Importance

Mangrove forests are also important for the local economy. They provide a source of food and medicine for the people who live in the area.

Sea Turtles: Sea turtles are a group of reptiles that live in the ocean. They are known for their long, pointed snouts and their ability to swim long distances.

Sea turtles are also important for the local economy. They provide a source of food and medicine for the people who live in the area.

Sea turtles are also important for the local economy. They provide a source of food and medicine for the people who live in the area.

Sea turtles are also important for the local economy. They provide a source of food and medicine for the people who live in the area.

Sea turtles are also important for the local economy. They provide a source of food and medicine for the people who live in the area.
