

The Endocrine System

Chapter Review / Study Guide

Worth up to 5 points on the exam!

1. Define hormone. **A chemical messenger that's transported in the blood.**
What distinguishes hormones from neurotransmitters? **Hormones are produced in the endocrine glands and are released into the bloodstream. A neurotransmitter is released into the synaptic gap by a terminal of stimulated presynaptic nerve cell, transmitting a nerve signal to its neighboring postsynaptic nerve.**
2. Describe the distinctions between endocrine and exocrine glands. **Exocrine glands secrete their substances through ducts onto your body's surfaces. Endocrine glands secrete their substances directly into your bloodstream.**
3. List the similarities and differences between the endocrine and nervous system.
Similarities:
 - Communication function: Both systems are involved in communication within the body, coordinating various physiological processes and activities by sending signals to target cells.
 - Homeostasis maintenance: Both systems work together to maintain the body's internal balance (homeostasis) by regulating different bodily functions.
 - Central control: Both systems are partially controlled by the hypothalamus in the brain.Differences:
Nervous system is electrical and chemical, quick, and affects one organ. The endocrine system is chemical only, slow, and affects many organs.
4. Which lobe of the pituitary is essentially composed of brain tissue? **The posterior lobe of the pituitary gland is composed of brain tissue. It's derived from the hypothalamus.**
5. Why do we consider the pituitary to be two separate glands? **The pituitary gland is composed of two lobes (anterior and posterior). They are regulated by the hypothalamus in different ways. The anterior secretes the GH and TSH hormones while posterior releases oxytocin and antidiuretic hormone.**
