

THE SKELETON
The skeleton is the framework of the body, supporting the soft organs and tissues. It is composed of bones and cartilage. The bones are made of a hard, white, mineralized substance called bone tissue. The cartilage is a soft, flexible tissue that connects the bones to each other and to the other parts of the body. The skeleton is divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs).

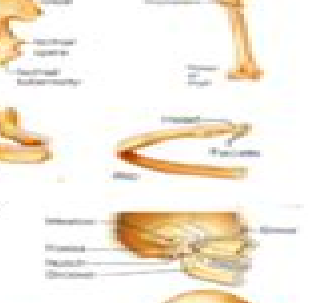

THE MUSCLES
The muscles are the soft tissue that contracts and relaxes to move the bones. They are made of muscle fibers that are connected to each other by a network of nerves. The muscles are divided into the skeletal muscles (which are attached to the bones) and the smooth muscles (which are found in the walls of the internal organs).

THE JOINTS
The joints are the points where two or more bones meet. They allow the bones to move relative to each other. There are three main types of joints: the ball-and-socket joint (hip and shoulder), the hinge joint (elbow and knee), and the pivot joint (neck).

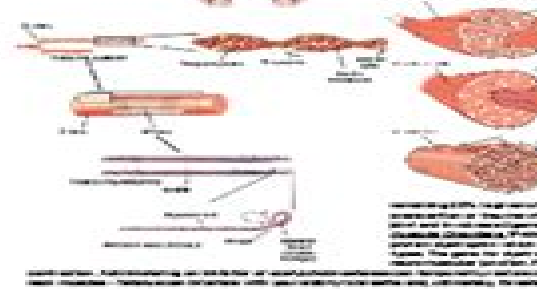

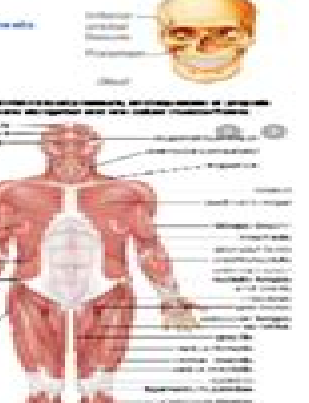

THE NERVOUS SYSTEM
The nervous system is the part of the body that controls and coordinates all the activities. It is made of the brain, the spinal cord, and the nerves. The brain is the control center of the body, and the spinal cord is the main pathway for the transmission of information between the brain and the rest of the body. The nerves are the branches of the spinal cord that carry the information to and from the muscles and other organs.

THE CIRCULATORY SYSTEM
The circulatory system is the part of the body that transports blood to and from the organs. It is made of the heart, the arteries, the veins, and the capillaries. The heart is the pump that moves the blood, and the arteries and veins are the pipes that carry the blood. The capillaries are the small blood vessels that allow the blood to deliver oxygen and nutrients to the cells and to pick up waste products.

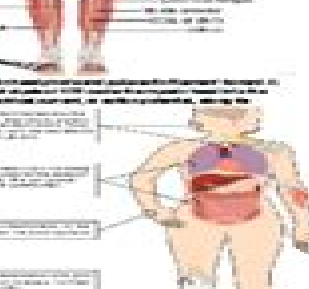

THE RESPIRATORY SYSTEM
The respiratory system is the part of the body that takes in oxygen and gets rid of carbon dioxide. It is made of the trachea, the bronchi, the bronchioles, and the alveoli. The trachea is the windpipe, and the bronchi and bronchioles are the airways that lead to the alveoli, where the exchange of gases takes place.

THE DIGESTIVE SYSTEM
The digestive system is the part of the body that breaks down the food into small pieces that can be absorbed by the body. It is made of the mouth, the esophagus, the stomach, the small intestine, the large intestine, and the rectum. The mouth is where the food is taken in, and the esophagus is the pipe that carries the food to the stomach. The stomach is where the food is broken down into small pieces, and the small intestine is where the nutrients are absorbed. The large intestine is where the waste is removed, and the rectum is where the waste is stored before it is eliminated from the body.

THE EXCRETORY SYSTEM
The excretory system is the part of the body that removes the waste products from the body. It is made of the kidneys, the ureters, the bladder, and the urethra. The kidneys are the organs that filter the blood and remove the waste products. The ureters are the pipes that carry the waste from the kidneys to the bladder. The bladder is where the waste is stored before it is eliminated from the body through the urethra.

THE IMMUNE SYSTEM
The immune system is the part of the body that defends the body against the disease-causing organisms. It is made of the white blood cells, the antibodies, and the organs of the immune system. The white blood cells are the cells that fight the disease-causing organisms, and the antibodies are the proteins that help the white blood cells to recognize and destroy the organisms. The organs of the immune system are the thymus, the spleen, the lymph nodes, and the bone marrow.
