Light Science Thomas Rossing, Christopher J Chiaverina, 1999-09-24 Intended for students in the visual arts and for others with an interest in art but with no prior knowledge of physics this book presents the science behind what and how we see The approach emphasises phenomena rather than mathematical theories and the joy of discovery rather than the drudgery of derivations The text includes numerous problems and suggestions for simple experiments and also considers such questions as why the sky is blue how mirrors and prisms affect the colour of light how compact disks work and what visual illusions can tell us about the nature of perception It goes on to discuss such topics as the optics of the eye and camera the different sources of light photography and holography colour in printing and painting as well as computer imaging and processing

M.C. Escher's Legacy Michele Emmer, Doris Schattschneider, 2007-05-08 From the reviews of the hardcover edition This conference to celebrate the centennial of the birth of Escher resulted in an immensely interesting collection of articles Although Escher himself is no longer among us M C Escher's Legacy like a garden of continually blooming flowers allows us to appreciate his heritage anew Notices of the AMS April 2003 It is a handsome volume and contains articles from 41 people which cover a wide range of artistic and analytical endeavour A quick dip into each section produces small gems there is enough here to provide rich pickings for any interested party no matter what their particular discipline is Embedded in the various articles are even snippets which illuminate Escher's intentions and his relationships with his mathematician friends Even though short these are rewarding to read the CD ROM is an excellent addition to the book and contains much more material including video excerpts from some of the lectures Australian Math Soc GAZETTE May 2003

The Geometry of an Art Kirsti Andersen,2008-11-23 Key Issues ever since the late 1970s when Pia Holdt a student of mine at the time and Jed Buchwald a colleague normally working in another field made me aware of how fascinating the

history of perspective constructions is I have wanted to know more My studies have resulted in the present book in which I am mainly concerned with describing how the understanding of the geometry behind perspective developed and how and to what extent new insights within the mathematical theory of perspective influenced the way the discipline was presented in textbooks In order to throw light on these aspects of the history of perspective I have chosen to focus upon a number of key questions that I have divided into two groups Questions Concerning the History of Geometrical Perspective How did geometrical constructions of perspective images emerge How were they understood mathematically How did the geometrical constructions give rise to a mathematical theory of perspective How did this theory evolve In connection with the last question it is natural to take up the following themes

Constant-Scale Natural Boundary Mapping to Reveal Global and Cosmic Processes Pamela Elizabeth Clark, Chuck Clark, 2013-09-06 Whereas conventional maps can be expressed as outward expanding formulae with well defined central features and relatively poorly defined edges Constant Scale Natural Boundary CSNB maps have well defined boundaries that result from natural processes and thus allow spatial and dynamic relationships to be observed in a new way useful to understanding these processes CSNB mapping presents a new approach to visualization that produces maps markedly different from those produced by conventional cartographic methods In this approach any body can be represented by a 3D coordinate system For a regular body with its surface relatively smooth on the scale of its size locations of features can be represented by definite geographic grid latitude and longitude and elevation or deviation from the triaxial ellipsoid defined surface A continuous surface on this body can be segmented its distinctive regional terranes enclosed and their inter relationships defined by using selected morphologically identifiable relief features e g continental divides plate boundaries river or current systems In this way regions of distinction on a large essentially spherical body can be mapped as two dimensional facets with their boundaries representing regional to global scale asymmetries e g continental crust continental and oceanic crust on the Earth farside original thicker crust and nearside thinner impact punctuated crust on the Moon In an analogous manner an irregular object such as an asteroid with a surface that is rough on the scale of its size would be logically segmented along edges of its impact generated faces Bounded faces are imagined with hinges at occasional points along boundaries resulting in a foldable shape model Thus bounded faces grow organically out of the most compelling natural features Obvious boundaries control the map's extremities and peripheral regions are not dismembered or grossly distorted as in conventional map projections 2D maps and 3D models grow out of an object's most obvious face or terrane edges instead of arbitrarily by imposing a regular grid system or using regularly shaped facets to represent an irregular surface
