Algebra and Geometry Hung-Hsi Wu, Hongxi Wu, 2020-09-08 This is the second of three volumes that together give an exposition of the mathematics of grades 9-12 that is simultaneously mathematically correct and grade level appropriate. The volumes are consistent with CCSSM Common Core State Standards for Mathematics and aim at presenting the mathematics of K-12 as a totally transparent subject. The first part of this volume is devoted to the study of standard algebra topics: quadratic functions, graphs of equations of degree 2 in two variables, polynomials, exponentials, and logarithms, complex numbers, and the fundamental theorem of algebra, and the binomial theorem. Having translations and the concept of similarity at our disposal enables us to clarify the study of quadratic functions by concentrating on their graphs; the same way the study of linear functions is greatly clarified by knowing that their graphs are lines. We also introduce the concept of formal algebra in the study of polynomials with complex coefficients. The last three chapters in this volume complete the systematic exposition of high school geometry that is consistent with CCSSM. These chapters treat the geometry of the triangle and the circle, ruler and compass constructions, and a general discussion of axiomatic systems including non-Euclidean geometry and the celebrated work of Hilbert on the foundations. This book should be useful for current and future teachers of K-12 mathematics as well as for some high school students and for education professionals.

Exercises in Linear Algebra and Geometry Francesco Bottacin, 2023-09-27 This book contains a collection of exercises designed to support and complement the theoretical exposition of the standard topics for a first course in linear algebra and geometry at university level. In this sense, this exercise book is a natural completion of the text F. Bottacin *Linear Algebra and Geometry* (Esculapio, Bologna), which will be referred to for the necessary theoretical notions. In presenting the solutions to the proposed exercises, my main goal is to try to teach how to approach and solve a problem. For this reason, in many cases, theoretical considerations have been included, and different solution methods have been proposed for the same type of exercise. The reader will thus be able to evaluate case by case the advantages and disadvantages of each method.

Algebra, Geometry and Mathematical Physics Abdenacer Makhoul, Eugen Paal, Sergei D. Silvestrov, Alexander Stolin, 2014-06-17 This book collects the proceedings of the Algebra, Geometry and Mathematical Physics Conference held at the University of Haute Alsace, France, October 2011. Organized in the four areas of algebra, geometry, dynamical symmetries, and conservation laws, and mathematical physics and applications, the book covers deformation theory and quantization, Hom algebras and n -ary algebraic structures, Hopf algebras, integrable systems, and related mathematical structures, jet theory, and Weil bundles, Lie theory and applications, non-commutative and Lie algebras, and more. The papers explore the interplay between research in contemporary mathematics and physics concerned with generalizations of the main structures of Lie theory aimed at quantization and discrete and non-commutative extensions of differential calculus and geometry, non-associative structures, actions of groups and semi-groups, non-commutative dynamics, non-commutative geometry, and applications in physics and beyond. The book

Using Algebraic Geometry David A. Cox, John Little, DONAL OSHEA, 2013-04-17 In recent years the discovery of new algorithms for dealing with polynomial equations coupled with their implementation on fast inexpensive computers has sparked a minor revolution in the study and practice of algebraic geometry These algorithmic methods have also given rise to some exciting new applications of algebraic geometry This book illustrates the many uses of algebraic geometry highlighting some of the more recent applications of Grobner bases and resultants In order to do this the authors provide an introduction to some algebraic objects and techniques which are more advanced than one typically encounters in a first course but nonetheless of great utility The book is written for nonspecialists and for readers with a diverse range of backgrounds It assumes knowledge of the material covered in a standard undergraduate course in abstract algebra and it would help to have some previous exposure to Grobner bases The book does not assume the reader is familiar with more advanced concepts such as modules
