ENGAGE

What are your physical traits? Compare yourself to one of your friends. The differences between you are found in your genetic makeup.

EXPLORE

The human genome is a complete set of nucleic acid sequences for humans. This is comprised of the data encoded as DNA found within the 23 chromosome pairs found within the human body. There are approximately three billion base pairs of DNA that are divided into about 20,000 to 25,000 genes.

EXPLANATION

The human genome is the complete DNA sequence of a human. The human genome includes the coding regions of DNA, which are responsible for encoding the 20,000 to 25,000 genes found within the human organism. It also includes the regions of DNA that do not encode any genes. These are distributed among 24 distinct chromosomes, including 22 autosomes and the X and Y sex chromosomes. These chromosomes hold the details of the physical and molecular characteristics of the human that contains them. The organization and structure of the DNA communicates the information contained within the genome. It also gives the genome the ability to replicate, repair, and maintain itself. Put simply, the genome is all the hereditary information encoded in the DNA, including the genes and non-coding sequences.
