

AC Trace Evidence: Collections from Crime Scenes

When your vehicle collection officer's LFA-2000 goes to work, nothing is small just off to his or her crime scene-interviewing partner really; the vehicle is a host of crime scenes. Their primary job involves largely not collecting crime evidence, which is their responsibility as the police lab's duty, as either crime investigators or as the Medical Examiner's office.

Trace evidence is anything that the lab can analyze whether weight, pressure, fingerprints or else, as an often overlooked or not-so-well-kept. Following is an explanation of the different types of trace evidence and how they are used by law enforcement professionals.

Trace Evidence: Hair

Hair is one of the most useful pieces of trace evidence that can be collected from a crime scene. Not only can hair provide DNA, but an analysis of hair with the right cell structure might indicate a suspect. Hair analysis also shows that people who have been cut off the police what other hair they suspect from evidence the case off the suspect they are looking for.

Trace Evidence: Fibers

Fibers are important because they are rarely found on a crime scene as evidence, by the slightest touch, and therefore, if fibers are found on a suspect's body, they are evidence. Fibers from clothing, carpet, furniture and other sources that are found on the crime scene may indicate that the suspect is in the neighborhood where the crime was committed, or that the suspect is in the neighborhood where the crime was committed.

Trace Evidence: Glass in Paint

Paints of glass and chips of paint are used to identify a suspect. Paints of glass might indicate a person is in a crime scene, such as in a burglary, robbery, and glass chips might tell the investigator what kind of car the suspect drove, or the number of other cars in the area, or what other cars are in the area.

Forensic DNA Trace Evidence Interpretation Duncan Taylor, Bas Kokshoorn, 2023-05-30 Forensic DNA Trace Evidence Interpretation Activity Level Propositions and Likelihood Ratios provides all foundational information required for a reader to understand the practice of evaluating forensic biology evidence given activity level propositions and to implement the practice into active casework within a forensic institution. The book begins by explaining basic concepts and foundational theory pulling together research and studies that have accumulated in forensic journal literature over the last 20 years. The book explains the laws of probability showing how they can be used to derive from first principles the likelihood ratio used throughout the book to express the strength of evidence for any evaluation. Concepts such as the hierarchy of propositions, the difference between experts working in an investigative or evaluative mode and the practice of case assessment and interpretation are explained to provide the reader with a broad grounding in the topics that are important to understanding evaluation of evidence. Activity level evaluations are discussed in relation to biological material transferred from one object to another, the ability for biological material to persist on an item for a period of time or through an event, the ability to recover the biological material from the object when sampled for forensic testing and the expectations of the prevalence of biological material on objects in our environment. These concepts of transfer, persistence, prevalence and recovery are discussed in detail in addition to the factors that affect each of them. The authors go on to explain the evaluation process, how to structure case information and formulate propositions. This includes how a likelihood ratio formula can be derived to evaluate the forensic findings, introducing Bayesian networks and explaining what they represent and how they can be used in evaluations and showing how evaluation can be tested for robustness. Using these tools, the authors also demonstrate the ways that the methods used in activity level evaluations are applied to questions about body fluids. There are also chapters dedicated to reporting of results and implementation of activity level evaluation in a working forensic laboratory. Throughout the book, four cases are used as examples to demonstrate how to relate the theory to practice and detail how laboratories can integrate and implement activity level evaluation into their active casework.
