

8.2 Checking and adjusting carburettor synchronisation (balance)

8 Start the engine and let it idle. If the gauges are fitted with damping adjustment, set this so that the needle flutter is just eliminated but so that they can still respond to small changes in pressure. Open the throttle slightly a couple of times then let the engine settle at idle.

9 The vacuum readings for both cylinders should be the same. If the vacuum readings differ, synchronise the carburettors by turning the synchronisation screw until the readings are the same (see illustration). **Note:** Do not press on the screw whilst adjusting it, otherwise a false reading will be obtained. Turn the screw a small amount at a time and allow the readings to stabilise before making further adjustments. When the carburettors are synchronised, open and close the throttle quickly to settle the linkage, and recheck the gauge readings, readjusting if necessary.

10 When the adjustment is complete adjust the idle speed (see Section 9), and check the throttle cable freeplay (see Section 10). Remove the gauges and refit the blanking cap or EVAP hose and the S&AS hose, making sure they are fully pushed onto their unions (see illustrations 8.6 and 8.4a).

9 Idle speed check and adjustment

1 The idle speed should be checked and adjusted before and after the carburettors are synchronised (balanced), after checking the valve clearances, and when it is obviously too

10.3 Twist the throttle and measure the amount of free rotation

9.3 Idle speed adjuster knob (arrowed)

high or too low. Before adjusting the idle speed, make sure the spark plugs are clean and the gaps correct, and the air filter is clean. If a valve clearance check is part of the service you are performing, do that first (see Section 24). Also, turn the handlebars from side-to-side and check the idle speed does not change as you do. If it does, the throttle cables may not be adjusted or routed correctly, or may be worn out. This is a dangerous condition that can cause loss of control of the bike. Be sure to correct this problem before proceeding.

2 Start the engine and let it run until it reaches normal operating temperature. Place the motorcycle on its sidestand, and make sure the transmission is in neutral.

3 The idle speed adjuster is a knurled knob located on the left-hand side of the carburettors (see illustration). With the engine idling, adjust the speed by turning the knob until the idle speed listed in this Chapter's Specifications is obtained. Turn the knob clockwise to increase idle speed, and anti-clockwise to decrease it.

4 Snap the throttle open and shut a few times, then recheck the idle speed. If necessary, repeat the adjustment procedure.

5 If a smooth, steady idle cannot be achieved, the fuel/air mixture may be incorrect (check the pilot screw settings - see Chapter 3 Specifications) or the carburettors may need synchronising (see Section 8), or the secondary air injection system may be faulty. Also check the intake duct rubbers for cracks which will cause an air leak, resulting in a weak mixture.

10.4 On Thruxton models pull back the boot to access the adjuster

10 Throttle cable check

1 Make sure the throttle grip rotates smoothly and freely from fully closed to fully open with the front wheel turned at various angles. The grip should return automatically from fully open to fully closed when released.

2 If the throttle sticks, this is probably due to a cable fault. Disconnect the cables at their upper ends (see Chapter 3) and lubricate them (see Section 1.4). Check that the inner cables slide freely and easily in the outer cables. If not, replace the cables with new ones. Note that in very rare cases the fault could lie in the carburettors rather than the cables, necessitating their removal and inspection (see Chapter 3).

3 With the throttle operating smoothly, check for a small amount of freeplay in the cables, measured in terms of the amount of twistgrip rotation before the throttle opens, and compare the amount to that listed in this Chapter's Specifications (see illustration). If it's incorrect, adjust the cables to correct it as follows.

4 On Thruxton models pull the rubber boot off the cable housing on the handlebar (see illustration).

5 Loosen the locknut on the opening cable then turn the adjuster until the specified amount of freeplay is obtained (see this Chapter's Specifications) (see illustration). Retighten the locknut. On Thruxton models fit the rubber boot.

6 If the adjuster has reached its limit, or if major adjustment is required, reset the adjuster so that the freeplay is at a maximum (i.e. the adjuster is fully turned in), then remove the fuel tank if required for best access (see Chapter 3), and adjust the cables at the carburettor end. Fully slacken the top nut on the opening cable and adjust the position of the cable elbow in the bracket by repositioning the lower nut as required, then tighten the top nut (see illustration). Any line alteration can be made at the handlebar end as in Step 5. If the cables cannot be adjusted as specified, install new ones (see Chapter 3).

10.5 Slacken the adjuster lock ring or nut and turn the adjuster as described
