Molecular Characterization of Humic Substances and Regulatory Processes Activated in Plants, 2nd edition Serenella Nardi, Luciano Pasqualoto Canellas, Andrea Ertani, Jose M Garcia-Mina, Diego Pizzeghello, Michela Schiavon, 2023-07-18 One of the main challenges of sustainable agriculture is improving food production while reducing significant impact on the soil water and other environmental resources In this context the use of humic substances extracted from different substrates in agricultural practices has been envisioned as a promising nature like and environmental friendly technology to support crop yield and quality Humic substances deriving from chemical and biological transformations of biota materials represent an intrinsic component of soil organic matter SOM consisting of associations of relatively small humic molecules linked together through hydrophobic interactions and hydrogen bonds Because of their distinctive physicochemical features they are used in several industrial and agricultural applications and in remediation technologies for metal contaminated soils Humic substances are of pivotal importance for environmental protection by conditioning soils and improving their stability and resistance to erosion In addition they possess inherent hormone like nature and exhibit biological activity This is often associated with complementary action of soil microbiota and is manifested in their capacity to modulate the transport and bioavailability of nutrients to plants influence root growth and architecture enhance crop yields and regulate the expression of a broad array of genes involved in plant metabolism development and resistance to stress Despite significant efforts to explain the molecular structure of humic substances and its relationship with a plurality of physiological responses and signalling networks triggered in plants several functional aspects still need to be clarified One major issue is that humic substances possess a very complex structure which accounts for their multifaceted

biological action Therefore this Research Topic aims to update the knowledge on humic substances by improving the current understanding of their structure and interactions with plants and associated rhizosphere microorganisms thus shining light on the mechanisms and cellular signalling pathways through which humic substances target specific plant metabolic routes and elicit physiological responses Implications of such interactions are expected to be assessed using differential methodological approaches under either small scale trials or field conditions in view of developing advanced and sustainable agriculture technologies aimed at improving crop yield and food quality *Advances in Legume Research* Diego Rubiales,Susana S. Araújo, Maria C. Vaz Patto,Nicolas Rispail,2018-11-08 Legumes crops have an extraordinary importance for the agriculture and the environment In a world urgently requiring more sustainable agriculture food security and healthier diets the demand for legume crops is on the rise The International Legume Society <http://ilsnsseme.com> organizes a triannual series of conferences with the goal to serve as a forum to discuss interdisciplinary progress on legume research The Second International Legume Society Conference ILS2 hosted in October 2016 at Troia Portugal was the starting point for the Research Topic *Advances in Legume Research* in FiPS that was also open to spontaneous submissions

Plant-Bacteria Association and Symbiosis Carlos Henrique Meneses,Diogo Neves Proença,Marcia Soares Vidal ,German Andres Estrada-Bonilla,2024-05-21 As a result of the environmental impacts associated with chemical fertilizer misuse society has turned its attention to alternative and sustainable forms of plant nutrition By providing substances that would otherwise be scarce plant growth promoting bacteria PGPBs can influence the availability of nutrients directly affecting plants metabolism In addition to fixing nitrogen and solubilizing phosphorus and iron they also produce hormones such as auxins gibberellins cytokinins and ethylene Studies with PGPB around the world must be directed towards biological control and growth promotion integrated into a sustainable management system Gradually the problems identified in research with biological control are being solved However erratic results regarding the bacterization of cultures frustrate researchers and result from a lack of understanding of plant microorganism interactions dynamics under various environmental conditions *Interactions between Bioactive Food Ingredients and Intestinal Microbiota, volume II* Zheng Ruan,Xiaodong Xia ,Fengjie Sun,2024-09-27 This is Volume II of the Research Topic *Interactions between Bioactive Food Ingredients and Intestinal Microbiota* The previous edition can be found here Numerous microorganisms colonize the gastrointestinal tract playing critical roles concerning digestion and absorption of dietary nutrients and the regulation of important functions including host metabolism immunity and intestinal barrier function Increasing evidence suggests that food encompassing nutrients and polyphenols are strong drivers shaping the composition and function of the gut microbiota and mediate the host's physiological activities directly or indirectly However the mechanisms involved in the interactions between food nutrients prebiotics gut microbiota and host health have not been enlightened to a wide extent **Exosomes as Therapeutic Systems** Robert Steven Conlan,Deyarina Gonzalez,Bruna Corradetti,Ines Mendes Pinto,2021-10-01

How Can Secretomics Help Unravel the Secrets of Plant-Microbe Interactions? Delphine Vincent, Kim Marilyn Plummer, Peter Solomon, Marc-Henri Lebrun, Dominique Job, Maryam Rafiqi, 2017-01-27

Secretomics describes the global study of proteins that are secreted by a cell, a tissue or an organism and has recently emerged as a field for which interest is rapidly growing. The term secretome was first coined at the turn of the millennium and was defined to comprise not only the native secreted proteins released into the extracellular space but also the components of machineries for protein secretion. Two secretory pathways have been described in fungi: i) the canonical pathway through which proteins bearing a N terminal peptide signal can traverse the endoplasmic reticulum and Golgi apparatus and ii) the unconventional pathway for proteins lacking a peptide signal. Protein secretion systems are more diverse in bacteria in which types I to VII pathways as well as Sec or two arginine Tat pathways have been described. In oomycete species effectors are mostly small proteins containing an N terminal signal peptide for secretion and additional C terminal motifs such as RXLRs and CRNs for host targeting. It has recently been shown that oomycetes exploit non conventional secretion mechanisms to transfer certain proteins to the extracellular environment. Other non classical secretion systems involved in plant-fungal interaction include extracellular vesicles (EVs). Figure 1 from Samuel et al 2016 Front Plant Sci 6:766. The versatility of oomycetes, fungi and bacteria allows them to associate with plants in many ways depending on whether they are biotroph, hemibiotroph, necrotroph or saprotroph. When interacting with a live organism, a microbe will invade its plant host and manipulate its metabolisms either detrimentally if it is a pathogen or beneficially if it is a symbiote. Deciphering secretomes became a crucial biological question when an increasing body of evidence indicated that secreted proteins were the main effectors initiating interactions, whether of pathogenic or symbiotic nature, between microbes and their plant hosts. Secretomics may help to contribute to the global food security and to the ecosystem sustainability by addressing issues in: i) plant biosecurity with the design of crops resistant to pathogens; ii) crop yield enhancement for example driven by arbuscular mycorrhizal fungi helping plant hosts utilise phosphate from the soil hence increase biomass; and iii) renewable energy through the identification of microbial enzymes able to augment the bio-conversion of plant lignocellulosic materials for the production of second generation biofuels that do not compete with food production. To this day more than a hundred secretomics studies have been published on all taxa and the number of publications is increasing steadily. Secretory pathways have been described in various species of microbes and/or their plant hosts yet the functions of proteins secreted outside the cell remain to be fully grasped. This Research Topic aims at discussing how secretomics can assist the scientists in gaining knowledge about the mechanisms underpinning plant-microbe interactions.
