You will be examining several characteristics of an unknown material. Use pocket page 13 to review the directional systems for this part. The practice of quantitation for this part is 111-112 shown.

The age of the fetus can be estimated by measuring the body length from the tip of the snout to the attachment of the tail on the pig's dorsal side. Compare this length to the data given on relative sizes of a fetal pig at different times during gestation or the time of development inside the uterus. (Note: $\text{cm} = 10 \text{ millimeters}$.)

24 days : 18 years	36 days : 30 years
36 days : 27 years	48 days : 36 years
48 days : 36 years	60 days : 45 years

Generally speaking, mammals are recognized and classified by their external appearance. The external features which separate mammals into orders include: the number of digits (toes or fingers) on the feet, method of walking or other locomotion, and characteristics of the teeth.

Mammals have two unique, universal characteristics which distinguish them from all other vertebrates: (1) all mammals have hair at some time during their development, and (2) all female mammals possess mammary glands with external openings for nourishing offspring with milk. Your fetal pig probably does not have a lot of hair due to the fact that it is not fully developed yet. However, all mature male pigs do have hair.

The tips around the mouth are well developed and the upper lip has a groove called the philtrum. Humans also have a philtrum. Then the robust mandibular bone came and lost almost every other line.

The statistical results described are derived on the basis

Examine the skin. They have a flexible outer flap called the *pinna*. The *pinna* helps the pig hear by focusing the sound waves that reach its ear.

Many mammals have sensory facial hairs called *vibrissae*; however, our pigs do not possess these yet. They are evident once a pig reaches maturity. They help organisms feel their way around in the dark. Vibrissae of dogs and cats are commonly called whiskers.
