

Chapter 33: Invertebrates Study Guide

For this chapter, focus on evolutionary relationships. Memorize the taxonomy of invertebrates. For each phylum: know what makes it unique and know examples of organisms in that phylum. You'll see the word synapomorphy a lot. Remember, a synapomorphy is a feature shared by members of a group which is derived from a common ancestor. Remember that a synapomorphy can be lost in some members through evolution (like a notochord in echinoderms).

Student Study Guide for Biology [by] Campbell/Reece Martha R. Taylor, 2002 Marty Taylor Cornell University Provides a concept map of each chapter chapter summaries a variety of interactive questions and chapter tests *Nuclear Science Abstracts*, 1972 **Invertebrate Immune Responses** Edwin L. Cooper, 2012-12-06 E L Cooper The Immunodefense System Because invertebrates are exceedingly diverse and numerous estimates reveal nearly 2 million species classified in more than 20 phyla from unicellular organisms up to the complex multicellular protostomes and deuterostomes It is not surprising to find less diverse defense immune responses whose effector mechanisms remain to be completely elucidated Of course I am not advocating that the few of us devoted to analyzing invertebrate immunity attempt the Herculean task of examining all these species to uncover some kind of unique response As these two volumes will reveal we are doing fairly well in examining in depth only the most miniscule examples of invertebrates some of which have great effects on human populations such as edible crustaceans or insect pests This is in striking contrast to the mass of information on the mammalian immune response which has been derived essentially from the mouse a member of one phylum Vertebrata an approach reductionist to be sure but one that has served well both the technological and conceptual advances of immunology as a discipline The essential framework of immunology the overwhelming burst of results since the 1960s have emanated primarily from this single animal We should not forget the thymus and the bird's bursa of Fabricius without which we might have been slower to recognize the bipartite T B system *Study Guide to Accompany Microbiology, Fourth Edition* George A. Ranaviruses and other viruses within the family Iridoviridae infect a wide range of ecologically and commercially important ectothermic vertebrates i.e. bony fish amphibians and reptiles and invertebrates including agricultural and medical pests and cultured shrimp and crayfish and are responsible for considerable morbidity and mortality Understanding the impact of these various agents on diverse host species requires the combined efforts of ecologists veterinarians pathologists comparative immunologists and molecular virologists Unfortunately investigators involved in these studies often work in discipline specific silos that preclude interaction with others whose insights and approaches are required to comprehensively address problems related to ranavirus iridovirus disease Our intent here is to breakdown these silos and provide a forum where diverse researchers with a common interest in ranavirus iridovirus biology can profitably interact As a colleague once quipped Three people make a genius We are hoping to do something along those lines by presenting a collection of research articles dealing with issues of anti viral immunity identification of a potentially novel viral genus exemplified by erythrocytic necrosis virus viral inhibition of innate immunity identification of novel hosts for lymphocystivirus and invertebrate iridoviruses and modelling studies of ranavirus transmission Collectively these and others will exemplify the breadth of ongoing studies focused on this virus family
