

Weathering, Erosion, and Deposition

Earth's surface is constantly changing and new land is constantly being formed! Rocks get *broken down* by **weathering**, *moved* through **erosion**, and *deposited*, or *dropped*, somewhere else through **deposition**.

Weathering is the process where rock is dissolved, worn away, or broken down into small pieces. Weathering can shape rocks into unusual formations. Water, wind, ice and plant roots are all causes of weathering. For example, rainwater can easily enter cracks in rocks. When it gets cold, the water may freeze and expand in the crack. The ice will eventually split the rock. Also, plant roots can grow in rocks and cause them to split.

Erosion is the process by which water, ice, wind, or gravity move pieces of rock and soil. The crushed rocks and rubble are called sediments and when it rains, they are washed away into streams. If it does not rain, strong winds can blow them away. Gravity makes soil and rocks move downhill. Erosion can happen quickly or take thousands of years. For

example, the Grand Canyon located in Arizona is a very big hole in the ground that is the result of constant erosion by the Colorado River. It took over millions of years as rocks were taken away.

Deposition is the dropping of sediment by wind, water, ice, or gravity. After pieces of the earth are moved through erosion, they are deposited somewhere else through deposition. It could be only a few feet away or many miles away. Deposition happens when water slows down or stops moving, the wind dies down or stops blowing, or when the glaciers melt. New landforms can also be created from the deposited material. For example, waves can deposit sediment in areas offshore, where they can build up to be sand dunes.

Weathering, erosion, and deposition are constantly changing our landscape. Can you imagine how most areas of our earth will look years from now?

Weathering as a Predisposing Factor to Slope Movements Domenico Calcaterra, Mario Parise, 2010 This volume is intended to provide an up to date overview of the approaches methodologies and techniques devoted to better understanding of the weathering conditions of rock masses on slopes According to the local conditions a variety of slope movements may take place and involve weathered rock masses Shallow and rapid soil slips evolving to debris flows are probably the most common type of slope movement At the same time deep seated intermittent landslides can also affect large volumes of weathered rocks and soils Despite the high frequency of landslides in weathered materials and the damage and casualties they repeatedly cause little is known about the relationship between weathering and slope movements This book presents worldwide case studies where a variety of geological and geomorphological settings are discussed The content is divided into three sections the first is devoted to broad aspects of the weathering landslide processes the second and third sections include papers dealing with igneous metamorphic and sedimentary weathered rocks respectively

Palaeoweathering, Palaeosurfaces and Related Continental Deposits Medard Thiry,Regine Simon

Coincon,2009-04-29 The study of palaeoweathering provides vital clues about pastcontinental environments the correlation of sedimentary depositsand processes such as the rate and timing of uplift and erosion This volume based partly on research presented at IGCP 317Palaeoweathering Records and Palaeosurfaces contains contributionsthat use both geochemical and

physical approaches to the study of palaeoweathering problems. The former are particularly relevant to our understanding of past climates and climate change; the latter have applications in the understanding of mass balance between rates of erosion and deposition. Palaeoweathering, Palaeosurfaces and Related Continental Deposits illustrates the multidisciplinary nature of the subject, the diversity of techniques and, above all, the vital contribution the subject makes to the reconstruction of ancient continental environments. This book will be of great value to sedimentologists, soil scientists and geomorphologists. Geology is the science of earth's crust, lithosphere, consisting of rocks and soils. While mining and mineralogical engineers are more interested in rocks, their petrology, formation and mineralogy, civil engineers are equally interested in soils and rocks in their formations and also in their properties for civil engineering design and construction. This book is so written that the subject can easily be taught by a civil engineering faculty member specialised in soil mechanics. Dexterously organized into four parts, this book in Part I, Chapters 1 to 11, deals with the formation of rocks and soils. The classification of soils, lake deposits, coastal deposits, wind deposits along with marshes and bogs are described in Part II, Chapters 12 to 20. As the book advances, it deals with the civil engineering problems connected with soils and rocks such as landslides, rock slides, mudflow, earthquakes, tsunami and other natural phenomena. In Part III, Chapters 21 to 24. Finally, in Part IV, Chapters 25 to 30, this text discusses the allied subjects like the origin and nature of cyclones, rock mass classification and soil formation. Designed to serve as a textbook for the undergraduate students of civil engineering, this book is equally useful for the practising civil engineers. **SALIENT FEATURES** Displays plenty of figures to clarify the concepts. Includes chapter end review exercises to enhance the problem solving skills of the students. Summary at the end of each chapter brings into focus the essence of the chapter. Appendices at the end of the text supply extra information on important topics. *Monthly Catalog of United States Government Publications* United States.
