

Applications of Area, Length and Distances

1. A sector of a circle is a region of the circle bounded by a central angle and the corresponding arc.

As proportional relationships exist between the central angle bounding the sector and the complete circle, these have previously determined relations that could be written provided that arc length, s , a central angle, θ (given a central angle) values or distances of rotation, θ has known your characteristic for arc length of a circle of radius, r is given by:

$$\text{Arc Length} = \frac{\theta}{360} (\text{circumference of circle})$$

Another way to find arc length is to think about, just as, where relationships. As you collected that the your table in this previous activity, you determined that arc length is directly a function of the circle's circumference and can be expressed in terms of π . This relationship can be summarized proportionally as circle of any given radius, r , is:

$$\frac{\text{Arc Length}}{2\pi r} = \frac{\text{Degrees of Rotation}}{360}$$

Similarly, you determined a function that could be written provided the arc length by a central angle in a circle of radius of distance of radius, r .

$$\text{Arc Length for Length of Rotation} = \frac{\theta}{360} (\text{circumference of circle})$$

As you collected that for your table in this previous activity, you determined that, the arc length, area of a sector (or area swept) is proportional to the circle's circumference can be expressed in terms of π . This relationship is summarized proportionally for a circle of any given radius, r is:

$$\frac{\text{Area of Sector}}{\pi r^2} = \frac{\text{Degrees of Rotation}}{360}$$

Example: (Based on previous activity and necessary.)

1. If the radius of a circle is 10 units and the angle is 60 degrees, find the arc length and area of the sector.
