Electron Crystallography of Organic Molecules J.R. Fryer, D. Dorset, 2012-12-06 Maximum Entropy ME techniques have found widespread applicability in the reconstruction of incomplete or noisy data These techniques have been applied in many areas of data analysis including imaging spectroscopy and scattering Gull and Skilling 1984 The techniques have proven particularly useful in astronomy Narayan and Nityanada 1984 In many of these applications the goal of the

reconstruction is the detection of point objects against a noisy background In this work we investigate the applicability of ME techniques to data sets which have strong components which are periodic in space or time The specific interest in our laboratory is High Resolution Electron Micrographs of beam sensitive materials However ME techniques are of general interest for all types of data These data may or may not have a spatial or temporal character Figure 1 shows an HREM image of the rigid rod polymer poly paraphenylene benzobisoxazole PBZO The 0.55 nm spacings in the image correspond to the lateral close packing between the extended polymer molecules Near the center of this crystallite there is evidence for an edge dislocation In HREM images both the frequency and position of the inflection is important for a proper interpretation Therefore it is necessary to consider how image processing affects the fidelity of this information in both real and Fourier space
