

Are the Everglades Forever?

by ReadWorks

"Snakes," Indiana Jones hisses through his teeth as he looks into a giant underground cavern. The floor of the pit is moving-thousands of snakes wriggling and writhing over one another. "Why did it have to be snakes?"

It's a famous scene from the movie "Raiders of the Lost Ark," in which the main character is confronted by his worst fear. It's just a movie, but the nightmarish slithering mass is becoming something of a reality in the Florida Everglades. **The Everglades, a famous region in Southern Florida, are a wetland ecosystem home to tropical and marshland plant and animal species.** The Everglades are a protected national park, but that doesn't mean that they're immune to harm. And guess what is one of the most recent and dangerous threats to the ecosystem? Indiana Jones, beware-it is snakes, and they're big ones.

was important because it is the main idea of the text

Reports from just over a year ago say that thousands of pythons have been making their homes in the Everglades at the expense of the native (natural to the area) species. Pythons and anacondas aren't normal inhabitants of the Florida ecosystem; **the ones that have taken over the Everglades are ex-pets and their offspring.** While it may seem cool that an exotic pet can survive on its own in an unfamiliar environment, these animals are unwelcome visitors. They've managed to upset the natural food chain so drastically that the Everglades are starting to seem a little bit like Indiana Jones's dreaded snake pit. Besides being creepy, an ecosystem overrun by pythons is unhealthy.

How did the pets/snakes even get out of the homes?

buzz words are important and considering the health of the everglades is also important

There's a lot to consider when talking about the health of an ecosystem and to better understand how scientists measure that, it's helpful to know what some of the buzzwords are. For starters, an ecosystem is defined as a community, characterized by the types of things (plants and animals) that live there; the type of environment around them; and the ways in which they all interact. There are ocean ecosystems, mountain ecosystems, rainforest ecosystems, desert ecosystems and even city ecosystems.

Within those systems, one of the main ways in which animals interact is in the constant search for food. The common term is "food chain," and it's a simple way to see how different species rely on one another. An example of a food chain is this: a rabbit eats grass, a snake comes along and eats the rabbit, and a hawk dives down to eat the snake. Food chains can get much longer and more

bewilderment as to why there were very high levels of mercury in the Everglades food web Soon came the finding that mercury loadings from atmospheric deposition accounted for over 95% of total input to the Everglades which resulted in Florida conducting the most comprehensive mercury monitoring and modeling study performed to date Topics discussed in this Volume include 1 Why atmospheric deposition fluxes of mercury to the Everglades are amongst the highest in the U S 2 That these are overwhelmingly from sources outside of the U S 3 That mitigation strategies for resolving the elevated food web mercury problem in the Everglades that rely solely on reducing atmospheric mercury inputs will not be effective for many decades 4 That consideration of other strategies in particular controlling factors related to Everglades mercury biogeochemical cycling seem warranted Agricultural Conservation Practices and Related Issues ,2004 *Wetland Systems for Water Pollution Control 2000* K.
