Improving Self-Escape from Underground Coal Mines National Research Council, Division of Behavioral and Social Sciences and Education, Board on Human-Systems Integration, Committee on Mine Safety: Essential Components of Self-Escape, 2013-06-26 Coal mine disasters in the United States are relatively rare events many of the roughly 50 000 miners underground will never have to evacuate a mine in an emergency during their careers However for those that do the

consequences have the potential to be devastating U S mine safety practices have received increased attention in recent years because of the highly publicized coal mine disasters in 2006 and 2010 Investigations have centered on understanding both how to prevent or mitigate emergencies and what capabilities are needed by miners to self escape to a place of safety successfully This report focuses on the latter the preparations for self escape In the wake of 2006 disasters the U S Congress passed the Mine Improvement and New Emergency Response Act of 2006 MINER Act which was designed to strengthen existing mine safety regulations and set forth new measures aimed at improving accident preparedness and emergency response in underground coal mines Since that time the efforts of the National Institute of Occupational Safety and Health NIOSH and the Mine Safety and Health Administration MSHA have contributed to safety improvements in the mining industry However the Upper Big Branch mine explosion in 2010 served as a reminder to remain ever vigilant on improving the prevention of mine disasters and preparations to help miners survive in the event of emergencies This study was set in the context of human systems integration HSI a systems approach that examines the interaction of people tasks and equipment and technology in the pursuit of a goal It recognizes this interaction occurs within and is influenced by the broader environmental context A key premise of human systems integration is that much important information is lost when the various tasks within a system are considered individually or in isolation rather than in interaction with the whole system
