4 Student A:
I wasn't a very motivated student when I was younger, so I failed my exams in 1999 and had to retake them the following summer. I'd already decided I wanted to take a gap year then go to business school, so this time I completed all the coursework and revised thoroughly; I passed easily. I spent a year abroad as an assistant in a secondary school and then went to business school – I'd already applied and successfully attended an interview before revisiting my exams.
In my second year as an undergraduate, I spent a semester as an intern at Hewlett Packard, which was very rewarding. In fact, I went straight into a job at HP after I graduated the following June. They encouraged me to do a Master's degree by correspondence – I just have to finish writing a dissertation. I need a break now, but I may take a sabbatical to study for an MBA in a few years' time.

Monthly magazine devoted to topics of general scientific interest **How Can the Human Mind Occur in the Physical Universe?** John R. Anderson Richard King Mellon Professor of Psychology and Computer Science Carnegie Mellon University,2007-07-18 The question for me is how can the human mind occur in the physical universe We now know that the world is governed by physics We now understand the way biology nestles comfortably within that The issue is how will the mind do that as well Allen Newell December 4 1991 Carnegie Mellon University The argument John Anderson gives in this book was inspired by the passage above from the last lecture by one of the pioneers of cognitive science Newell describes what for him is the pivotal question of scientific inquiry and Anderson gives an answer that is emerging from the study of brain and behavior Humans share the same basic cognitive architecture with all primates but they have evolved abilities to

exercise abstract control over cognition and process more complex relational patterns The human cognitive architecture consists of a set of largely independent modules associated with different brain regions In this book Anderson discusses in detail how these various modules can combine to produce behaviors as varied as driving a car and solving an algebraic equation but focuses principally on two of the modules the declarative and procedural The declarative module involves a memory system that moment by moment attempts to give each person the most appropriate possible window into his or her past The procedural module involves a central system that strives to develop a set of productions that will enable the most adaptive response from any state of the modules Newell argued that the answer to his question must take the form of a cognitive architecture and Anderson organizes his answer around the ACT R architecture but broadens it by bringing in research from all areas of cognitive science including how recent work in brain imaging maps onto the cognitive architecture
