Fundamental Aspects of Plasma Chemical Physics Mario Capitelli, Roberto Celiberto, Gianpiero Colonna, Fabrizio

Esposito, Claudine Gorse, Khaled Hassouni, Annarita Laricchiuta, Savino Longo, 2015-11-26 Describing non equilibrium cold plasmas through a chemical physics approach this book uses the state to state plasma kinetics which considers each internal state as a new species with its own cross sections Extended atomic and molecular master equations are coupled with Boltzmann and Monte Carlo methods to solve the electron energy distribution function Selected examples in different applied fields such as microelectronics fusion and aerospace are presented and discussed including the self consistent kinetics in RF parallel plate reactors the optimization of negative ion sources and the expansion of high enthalpy flows through nozzles of different geometries The book will cover the main aspects of the state to state kinetic approach for the description of nonequilibrium cold plasmas illustrating the more recent achievements in the development of kinetic models including the self consistent coupling of master equations and Boltzmann equation for electron dynamics To give a complete portrayal the book will assess fundamental concepts and theoretical formulations based on a unified methodological approach and explore the insight in related scientific problems still opened for the research community **Distributed Computing** Idit

Rate-Modifying Activities Vitaly A. Strusevich, Kabir Rustogi, 2016-10-18 In scheduling theory the models that have attracted considerable attention during the last two decades allow the processing times to be variable i e to be subjected to various effects that make the actual processing time of a job dependent on its location in a schedule The impact of these effects includes but is not limited to deterioration and learning Under the first type of effect the later a job is scheduled the longer its actual processing time becomes In the case of learning delaying a job will result in shorter processing times Scheduling with Time Changing Effects and Rate Modifying Activities covers and advances the state of the art research in this area The book focuses on single machine and parallel machine scheduling problems to minimize either the maximum completion time or the sum of completion times of all jobs provided that the processing times are subject to various effects Models that describe deterioration learning and general non monotone effects to be considered include positional start time dependent cumulative and their combinations which cover most of the traditionally used models The authors also consider more enhanced models in which the decision maker may insert certain Rate Modifying Activities RMA on processing machines such as for example maintenance or rest periods In any case the processing times of jobs are not only dependent

on effects mentioned above but also on the place of a job in a schedule relative to an RMA For most of the enhanced models described in the book polynomial time algorithms are presented which are based on similar algorithmic ideas such as reduction to linear assignment problems in a full form or in a reduced form discrete convexity and controlled generation of options
