

THE SKELETON
The skeleton is the framework of the body, supporting the soft tissues and organs. It is composed of bones and cartilage. The bones are made of a hard, white, mineralized tissue called bone. The cartilage is a soft, white, fibrous tissue that connects the bones. The skeleton is divided into the axial skeleton (skull, spine, and rib cage) and the appendicular skeleton (arms and legs). The bones of the axial skeleton are the skull, spine, and rib cage. The bones of the appendicular skeleton are the arms and legs. The bones of the skull are the cranium and the mandible. The bones of the spine are the cervical, thoracic, lumbar, sacrum, and coccyx. The bones of the rib cage are the ribs, costal cartilage, and sternum. The bones of the arms are the humerus, radius, ulna, and carpals. The bones of the legs are the femur, tibia, fibula, and tarsals.

BONE TISSUE
Bone tissue is a specialized form of connective tissue. It is composed of osteoblasts, osteoclasts, and osteons. Osteoblasts are cells that form bone tissue. Osteoclasts are cells that resorb bone tissue. Osteons are the basic structural units of bone tissue. They are composed of concentric layers of bone tissue called lamellae. The center of an osteon is a blood vessel called a Haversian canal. The spaces between osteons are called interstitial spaces. They contain blood vessels and nerves.

BONE DEVELOPMENT
Bones develop from mesenchymal tissue. The process of bone development is called ossification. There are two main types of ossification: intramembranous and endochondral. Intramembranous ossification occurs in the flat bones of the skull. Endochondral ossification occurs in the long bones of the arms and legs. Both types of ossification involve the formation of a bone model from a cartilaginous model. The model is then replaced by bone tissue.

JOINTS
Joints are the points of connection between two or more bones. They allow for movement of the bones. There are three main types of joints: fibrous, cartilaginous, and synovial. Fibrous joints are the least movable. Cartilaginous joints are slightly more movable. Synovial joints are the most movable. They have a synovial cavity that contains synovial fluid. The synovial fluid lubricates the joint and reduces friction. The joint capsule surrounds the joint and holds the bones together.

MUSCLES
Muscles are the organs that contract and relax to produce movement. They are composed of muscle fibers. Muscle fibers are long, cylindrical cells with multiple nuclei. They are surrounded by a layer of connective tissue called the sarcolemma. The sarcolemma contains voltage-gated ion channels. The interior of the muscle fiber contains myofibrils. Myofibrils are the contractile units of the muscle. They are composed of actin and myosin filaments. Actin filaments are thin filaments. Myosin filaments are thick filaments. The interaction between actin and myosin filaments produces contraction.

Myoblasts are cells that fuse to form muscle fibers. The fusion of myoblasts is called myotube formation. The myotube then matures into a muscle fiber.
