aneurysms explored by such pioneers of neurosurgery as Cushing and Dandy were the giant intracranial aneurysms These
giant aneurysms present many therapeutic difficulties and because of their unique anatomical features and size may present
in a multitude of ways With the advent of specialized imaging techniques such as computed tomography CT mag netic
resonance imaging MRI and selective angiography preoperative diag nosis today is most often accomplished without
difficulty However com pletely thrombosed giant aneurysms may mimic other lesions with mass effect such as basilar
meningiomas chordomas or chondromas and their true anatomical shapes and relations to other cranial structures can only
be ascer tained by direct operative inspection Due to their morphological features thrombosed nonthrombosed par tially
thrombosed fusiform anatomical variations and difficult locations giant aneurysms present new challenges for the modern
neurosurgeon Al though microsurgical techniques have rendered direct surgical treatment of giant intracranial aneurysms
safer elimination of the aneurysm without dis turbing the hemodynamics continues to be problematic Some of these lesions
have relatively small necks and can therefore be clipped fairly easily Others have large necks are fusiform or contain
perforators how best to treat these lesions is a question still unresolved by presentday neurosurgery **Dunhill Golf**
